BESSER-MATIC MS-13
SPECIFICATIONS

TOTAL WEIGHT: 27,198 Lbs [10976 Kg]

APPROXIMATE WEIGHT OF EACH COMPONENT:

Accumulators (2): 2500 Lbs [1134 Kg] each
Frame: 2000 Lbs [900 Kg]
Unloading conveyors (3): 1250 Lbs [568 Kg] each
Front delivery conveyors (2): 1250 Lbs [568 Kg] each
Loaders / Unloaders (2): 3000 Lbs [1364 Kg] each
Pallet return conveyors (2): 500 Lbs [227 Kg] each
Rackveyor total: 5050 Lbs [2295 Kg]
Side shifter: 2250 Lbs [1021 Kg]
Front section: 1000 Lbs [455 Kg]
Center section: 1800 Lbs [818 Kg]
Panel assembly: 1400 Lbs [635 Kg]
Graphic control station: 325 Lbs [148 Kg]
Items shipped loose: 3000 Lbs [1361 Kg]

MINIMUM HYDRAULIC PRESSURE: 850 psi [58 bar]

MACHINE SPEED: Up to 10 cycles per minute

PRODUCTION CAPACITY: Up to 11 pallets high with 26" X 18 1/2" [660mm X 470mm] pallets
3000 lbs. maximum Accumulator load
Other pallet heights and pallet sizes available and will vary from
customer to customer.

OPERATING CONDITIONS:
Besser machinery and equipment is designed to comply with the essential health and safety regulations (EHSR) that
apply to directives which are applicable to an industrial environment.
Buyer shall utilize this equipment in a manner consistent with its design and only in an industrial environment.

OPERATING RANGES:
Here are the normal operating ranges for machine sensors (limit, proximity) and control devices contained within the
control panels.

Ambient operating temperature range: 32° to 131°F [0° to 55°C]
Humidity range: 5 to 95% (non-condensing)
Line voltage: 85 to 132 Volts - AC 50/60 Hz
### Pallet Requirements:

- **Width & Depth** = Actual size of steel pallet.
- **Xmax & Ymax** = Maximum production area of steel pallet.

SAFETY BULLETIN

This notice is issued to advise you that some previously accepted shop practices may not be keeping up with changing Federal and State Safety and Health Standards. Your current shop practices may not emphasize the need for proper precautions to insure safe operation and use of machines, tools, automatic loaders and allied equipment and/or warn against the use of certain solvents or other cleaning substances that are now considered unsafe or prohibited by law. Since many of your shop practices may not reflect current safety practices and procedures, particularly with regard to the safe operation of equipment, it is important that you review your practices to ensure compliance with Federal and State Safety and Health Standards.

IMPORTANT

The operation of any machine or power-operated device can be extremely hazardous unless proper safety precautions are strictly observed. Observe the following safety precautions:

⚠️ Always be sure proper guarding is in place for all pinch, catch, shear, crush and nip points.
⚠️ Always make sure that all personnel are clear of the equipment before starting it.
⚠️ Always be sure the equipment is properly grounded.
⚠️ Always turn the main electrical panel off and lock it out in accordance with published lockout/tag-out procedures prior to making adjustments, repairs, and maintenance.
⚠️ Always wear appropriate protective equipment like safety glasses, safety shoes, hearing protection and hard hats.
⚠️ Always keep chemical and flammable material away from electrical or operating equipment.
⚠️ Always maintain a safe work area that is free from slipping and tripping hazards.
⚠️ Always be sure appropriate safety devices are used when providing maintenance and repairs to all equipment.
⚠️ Never exceed the rated capacity of a machine or tool.
⚠️ Never modify machinery in any way without prior written approval of the Besser Engineering Department.
⚠️ Never operate equipment unless proper maintenance has been regularly performed.
⚠️ Never operate any equipment if unusual or excessive noise or vibration occurs.
⚠️ Never operate any equipment while any part of the body is in the proximity of potentially hazardous areas.
⚠️ Never use any toxic flammable substance as a solvent cleaner.
⚠️ Never allow the operation or repair of equipment by untrained personnel.
⚠️ Never climb or stand on equipment when it is operational.

It is important that you review Federal and State Safety and Health Standards on a continual basis. All shop supervisors, maintenance personnel, machine operators, tool operators, and any other person involved in the setup, operation, maintenance, repair or adjustment of Besser-built equipment should read and understand this bulletin and Federal and State Safety and Health Standards on which this bulletin is based.

OVERALL DIMENSIONS

(ref. installation print #5):

Figure A. BESSER-MATIC MS-13/14/16 DIMENSIONS
OPERATOR ORIENTATION:
Seen from behind, facing the Concrete Product Machine, the machine shown below is a right hand machine. This means the loading of new units is done from the right side. The sides loading and unloading, as mentioned throughout this manual, are as shown here.

Figure B. OPERATOR ORIENTATION
1.1 HOW A BESSER-MATIC MULTI-SPADE WORKS

The Besser-Matic Multi-Spade is extremely versatile. It is designed to fit into all plant layouts and can handle the output of all Besser concrete products machines. It is built solid with heavy duty components and the most current technology available.

The Besser-Matic gently loads and unloads concrete products onto and off of racks, automatically. The Besser-Matic handles paving stone, architectural units and solids as well as it handles standard units.

The machine is comprised of two separate accumulators each equipped with a spade loader or unloader. The loader accumulator of the Besser-Matic receives pallets of green units from the front delivery conveyor of the concrete products machine.

The spade loader moves in and elevates to pick up a load. Once the loader spade is full, the spade rotates 180 degrees and moves forward, gently depositing the pallets of green units into a rack. The spade then rotates 180 degrees and returns to the accumulator for another load of green concrete units.

Simultaneously, the spade unloader of the Besser-Matic retrieves cured pallets of units from the racks, rotates 180 degrees, travels forward and deposits the pallets into the unloader accumulator, which in turn sets the pallets one at a time onto the unloading conveyor.

When the loader and unloader spades have filled or emptied their respective bays, the rack conveyor indexes to the next bay or to the next rack.
1.2 MULTI-SPADE ASSEMBLY (RIGHT HAND SYSTEM SHOWN)

**Figure 1.2** SIDE SHIFTER AND RACKVEYOR
1.4 CONVEYORS (RIGHT HAND SYSTEM SHOWN)

Figure 1.3 CONVEYORS
SECTION 2
MACHINE INITIAL SET-UP

This section explains how to set up the Besser-Matic Multi-Spade. It will take the operator step by step through the final adjustments on the machine. Follow this section carefully. If you are also installing a Rack Transporter System such as a LSC-75, you should follow instructions for both these systems simultaneously. Make sure the machine has been installed properly as shown in the installation manual.

2.1 LOADER SIDE

NOTE: All switches must be adjusted in manual mode (see section 4.2)

2.1.1 Front Delivery Conveyor Set-Up (Concrete Product Machine End)

1. Set delivery height of the front delivery conveyor (refer to sheet 6 of the Installation drawing).

2. Proximity switch (PRS-2A) should be adjusted 1/4" [6.3mm] below the bottom of pallet sitting on chain.

2.1.2 Front Delivery Conveyor Set-Up (Accumulator End)

1. Switch (PRS-28) should be adjusted 1/4" [6.3mm] below the bottom of pallet. (Figure 2.2)

2. Switch must be adjusted so pallet is in pick-up position when switch is released.

Figure 2.1 PROXIMITY SWITCH PRS-2A

Figure 2.2 PROXIMITY SWITCH PRS-28
2.1.3 Position for Shelf Angle Home Switch on the Accumulator

PRS-1 is located on the side of the Accumulator and senses the shelf angle in order to stop the Accumulator just before it reaches the pallet.

1. Adjust PRS-1 switch so that shelf angle is stopped when top of angle is 1/4" [6.3mm] below bottom of pallet or as close as possible to provide smooth pallet pick-up. See Figure 2.3.

2. Run to next shelf angle to verify the position of the switch.

Figure 2.3 LIMIT SWITCH PRS-1 WITHOUT GENEVA DRIVE

2.1.4 Position for Full Load Switch on Accumulator

LS-55 is a safety switch on top of the Accumulator. It should be adjusted 2" [51mm] above the highest product on the top shelf.

Figure 2.4 LIMIT SWITCH LS-55

---

Figure 2.5 LIMIT SWITCH PRS-1 WITH GENEVA DRIVE
2.1.5 Location of Frame Actuators

Actuators on MS-13/14/16 frame are positioned along the track and will trip a switch located on the moving stabilizer. When this switch is tripped, the loading spade stops. It will stop once in the loader Accumulator, once at the entrance of the loader Accumulator, once at center and several times inside the rack. How many times it stops in the rack is dependent on your rack depth. For example, if you have a 4 pallet deep rack system, the loader spade will stop 4 times inside the rack. To adjust frame actuators, see Figure 2.6 and follow the steps.

1. Locate actuator for center-in/center-out.
2. Locate actuator to position pallet in rack (depends on how deep system is).
3. Set all actuators according to dimensions shown in Figure 2.6 and on frame drawing supplied.

**NOTE:** Final adjustments will have to be made when spade actually goes through its cycle (either on manual or automatic runs).

---

**Figure 2.6** FRAME ACTUATORS ON LOADING SIDE (VIEWED FROM ABOVE)
2.1.6 Adjustment of Geneva Drive

1. Remove pallets from accumulator and follow lockout/tagout procedure

2. Tighten both elevator chains from bottom, allowing no more than 2" slack

3. Adjust elevator chains to pick up and drop off pallets evenly from side to side

4. Set shelf angles 1/4" below pallet on conveyor after the system is set to the proper elevation.

5. Loosen chain tensioner and remove drive chain from upper cam

6. Rotate lower cam to align cam followers parallel to drive housing

7. Reassemble drive chain to upper cam and tighten chain tensioner

   IMPORTANT: Do not move cams during reassembly.

8. Adjust PRS1 to stop Geneva in this position

   NOTE: If necessary, repeat procedure and rotate lower cam to adjust timing. Cam followers will no longer be parallel to drive housing.

---

**Figure 2.7 GENEVA DRIVE ADJUSTMENT**
2.1.7 **Adjust Spade Switches**

The spade stabilizer has 8 switches: 2 safety proximity switches, 4 turn proximity switches, 1 frame actuator proximity switch and 1 center in/center out limit switch. All of these switches are illustrated in Figure 2.9 below and need to be adjusted as follows:

1. Adjust switch LS-19 to make sure it trips on frame center in/out actuator.
2. Adjust proximity switch PRS-16 to be actuated by frame actuators along the track. Switch should be adjusted 1/4" [6.3mm] above highest frame actuator. Run the spade on manual along the frame to test the switch. Use screen to monitor switch. It should turn ON when switch is above each frame actuator. If not, adjust switch lower.

**NOTE:** Left Hand shown. For Right Hand, PRS7 and PRS7A change locations with PRS8 and PRS8A.

4. There is one 180° turn switch at each end of stabilizer, PRS-7 and PRS-8. These proximity switches should be adjusted 1/4" [6.3mm] from actuator (Figure 2.8 below). Both these switches are adjustable sideways through slots. Adjust both 180° turns so spade aligns perfectly with Accumulator and rack center line.

**NOTE:** Spade should turn toward the inside of frame.

---

**Figure 2.8** TURN SWITCHES

**Figure 2.9** STABILIZER SWITCHES
2.1.8 Adjust Multiple Limit Switches (MLS) 

Loader

A MLS (Figure 2.10) is located on the loader spade. 5 switches control the up and down movement of the lower spade. It is important to adjust the cams so that switches are actuated at a precise location. Figure 2.11 below identifies all 5 switches in the switch box.

1. Determine if your system is an “up to rack” system or a “down to rack” system. An “up to rack” system is a system where lower spade goes from the Accumulator up to the rack. A “down to rack” system is a system where lower spade goes from the Accumulator down to the rack.

2. Make sure all cams trip switches properly. Screen should indicate when switch has been tripped. (refer to Section 5, function F3 - input/output). It is important to adjust cams knowing up or down direction.

3. Refer to Figure 2.11 below to identify switch direction and approximate cam locations. Remember that these cam locations are approximate; they will need to be adjusted as shown here.

---

**Figure 2.10** MULTIPLE LIMIT SWITCH (MLS)

**Figure 2.11** CAM CONFIGURATION (APPROXIMATE)
4. Manually move the spade (see section 4.2) until it reaches the Accumulator but does not enter. Move spade up and down until the spade shelf is 1/2" [12.7mm] below the pallet as presented in Figure 2.12. Then, move cam until switch PRS-22 is actuated (screen will indicate that switch has been tripped).

**NOTE:** After moving cam to desired position, carefully tighten cam so it does not move.

5. Manually move the spade (see section 4.2) into the Accumulator. Then move spade up and down until bottom of pallet is 1/2" [12.7mm] above shelf angle (see Figure 2.13). Then, move cam until switch PRS-12 is actuated (screen will indicate that switch has been tripped).

---

**Figure 2.12** SWITCH PRS -22 ADJUSTMENT

**Figure 2.13** SWITCH PRS -12 ADJUSTMENT
6. Manually move the spade (see section 4.2) until it reaches the rack but does not enter. Then move spade up and down until bottom of pallet is 1/2" [12.7mm] above rack shelf (see Figure 2.14). Then move cam until switch PRS -13 is actuated (screen will indicate that switch has been tripped).

![Figure 2.14 SWITCH PRS -13 ADJUSTMENT](image)

7. Manually move the spade (see section 4.2) inside the rack bay. Then move spade up and down until top of empty spade is 1/2" [12.7mm] below pallet laying on rack shelf (see Figure 2.15). Then move cam until switch PRS -23 is actuated (screen will indicate that switch has been tripped).

![Figure 2.15 SWITCH PRS -23 ADJUSTMENT](image)

8. Adjust safety switch LS-14 (with red dot) 1" [25.4mm] above top of highest stroke (1" [25.4mm] above extreme position) and 1" [25.4mm] below lowest stroke (lower extreme).
2.2 UNLOADER SIDE

2.2.1 Accumulator Switches

1. Adjust PRS-95 so that the top of the shelf angle on Accumulator is 1/2" [12.7mm] below the bottom of pallet sitting on conveyor.

2.2.2 Unloading Conveyor Switches

1. All switches on unloading conveyor should be adjusted 1/4" [6.35mm] below the bottom of the pallet sitting on chain.

2. Adjust PRS-42 (Figure 2.16) so that pallet is clear of Accumulator conveyor when switch is tripped and released, if PRS-43 is not covered.

3. Adjust PRS-43 (Figure 2.16) 1/4" [6.3mm] below pallet sitting on chain. PRS-43 is a safety switch. If PRS-43 is tripped, Accumulator will not move.

   PER-202 is a photoelectric eye switch that senses across the depalleter to detect block on pallet in Depalleter.
   PRS-30 stops pallet on unloading conveyor if PRS-9 is covered by pallet.
   PRS-9 will stop pallet in center of Depalleter. Adjust switch so pallet is stopped at center line of Depalleter.

Figure 2.16 PRS-42 AND PRS-43
### 2.2.3 Rollover Switches

1. Adjust PRS-641 so that it indicates that pallet is completely into the rollover system. This will start rollover. Also adjust switch 1/4" [6.35mm] below pallet sitting on chain. See Figure 2.17.

2. Adjust PRS-642 home switch so rollover stops at point where it can receive pallet in slot and drop pallet off.

**NOTE:** Adjust switch with no pallet in rollover.

3. Adjust PRS-643 proximity-switch so it is tripped after rollover is 1/4" [6.35mm] below pallet. It indicates that the rollover is clear and a new pallet can be rolled. See Figure 2.17.

---

**Figure 2.17 ROLLOVER SWITCHES**
2.2.4 Location of Frame Actuators

Actuators on MS-13/14/16 frame are positioned along the track and will trip a switch located on the moving stabilizer. When this switch is tripped, the unloading spade stops. It will stop once in the unloader Accumulator, once in the center and several times inside the rack. How many times it stops in the rack is dependent on your rack depth. For example, if you have a 4 pallet deep rack system, the unloader spade will stop 4 times inside the rack. Use frame assembly drawing along with the written instructions below to adjust frame actuators:

1. Locate actuator for center-in / center-out (shown below).
2. Locate actuator to position pallet in rack (depends on how deep system is).
3. Set all actuators according to dimensions shown in Figure 2.18 below and on frame drawing supplied.

NOTE: Final adjustments will have to be made when spade actually places pallets in rack as it goes through its cycle (either on manual or automatic runs).

Figure 2.18 FRAME ACTUATORS ON UNLOADING SIDE (VIEWED FROM ABOVE)
2.2.5 Adjust Spade Switches

The spade stabilizer has 8 switches: 2 safety proximity switches, 4 turn prox-switches, 1 frame actuator proximity switch and 1 center-in/center-out limit switch. All of these switches are illustrated in Figure 2.20 below and need to be adjusted as follows:

1. Adjust switch LS-26 to make sure it trips on frame center in/out actuator.

2. Adjust proximity switch PRS-25 to be actuated by frame actuators along the track. Switch should be adjusted 1/4" [6.3mm] above highest frame actuator. Run the spade on manual along the frame to test the switch. Use screen to monitor switch. It should turn ON when switch is above each frame actuator. If not, adjust switch lower.

4. There is one 180° turn switch at each end of stabilizer, PRS-47 and PRS-48. These proximity switches should be adjusted 1/4" [6.3mm] from actuator (Figure 2.19). Both these switches are adjustable sideways through slots. Adjust both 180° turns so spade aligns perfectly with Accumulator and rack center line.

NOTE: Spade should turn toward the inside of frame.

Figure 2.19 TURN SWITCHES

Figure 2.20 STABILIZER SWITCHES
2.2.6 Adjust Multiple Limit Switches (MLS) Unloader

A MLS (Figure 2.21) is located on the unloader spade. 5 switches control the up and down movement of the lower spade. It is important to adjust the cams so that switches are actuated at a precise location. Figure 2.22 below identifies all 5 switches in the switch box.

1. Determine if your system is an “up to rack” system or a “down to rack” system. An “up to rack” system is a system where lower spade goes from the Accumulator up to the rack. A “down to rack” system is a system where lower spade goes from the Accumulator down to the rack.

2. Make sure all cams trip switches properly. Screen should indicate when switch has been tripped. (refer to Section 3, function F3 - input/output). It is important to adjust cams knowing up or down direction.

3. Refer to Figure 2.22 below to identify switch direction and approximate cam locations. Remember that these cam locations are approximate; they will need to be adjusted as shown here.

![Figure 2.21 MULTIPLE LIMIT SWITCH (MLS)](image)

![Figure 2.22 CAM BOX CONFIGURATION (APPROXIMATE)](image)
4. With empty pallets set on the unloading spade, manually move the spade (see section 4.2) until it reaches the Accumulator but does not enter. Then move spade up and down until the bottom of pallet is 1/2” [12.7mm] above shelf angle as presented in Figure 2.23. Then move cam until switch PRS -24 is actuated (screen will indicate that switch has been tripped).

**NOTE:** After moving cam to desired position, carefully tighten cam so it does not move.

5. Manually move the spade (see section 4.2) inside the Accumulator. Then move spade up and down until bottom of pallet is 1/2” [6.3mm] below shelf angle (see Figure 2.24). Then move cam until switch PRS -31 is actuated (screen will indicate that switch has been tripped).

---

**Figure 2.23 SWITCH PRS -24 ADJUSTMENT**

**Figure 2.24 SWITCH PRS -31 ADJUSTMENT**
6. Manually move the spade (see section 4.2) until it reaches the rack but does not enter. Then move spade up and down until top of spade is 1/2" [12.7mm] below bottom of pallet (see Figure 2.25). Then move cam until switch PRS -35 is actuated (screen will indicate that switch has been tripped).

7. Manually move the spade (see section 4.2) inside the rack bay. Then move spade up and down until bottom of pallet is 1/2" [12.7mm] above rack shelf (see Figure 2.26). Then move cam until switch PRS -32 is actuated (screen will indicate that switch has been tripped).

8. Adjust safety switch LS-34 (with red dot) 1" [25.4mm] above top of highest stroke, (1" [25.4mm] above extreme position) and 1" [25.4mm] below lowest stroke (down extreme).
2.2.7 Conveyor Switches

1. The PRS-630 switch is located on the unloading conveyor (just before the Pallet Transfer conveyor). It is used to stop the unloading conveyor when Pallet Transfer is in motion (not in home position).

2. LS-63 switch stops the Pallet Transfer conveyor at home position when lug is approximately 2” to 3” [51 to 76mm] behind pallet, ready to push next pallet.

3. PER-68 is a photoelectric switch located on the Pallet Return conveyor. It is used to detect a pallet jammed between rollers. A timer will shut off machine after a preset timer has timed out. See Figure 2.27.

![Diagram of PER-68 switch]

Figure 2.27 SWITCH PER-68
2.2.8 Concrete Product Machine Pallet Magazine

The Pallet Return conveyor will be shut off by two proximity switches located in the Concrete Product Machine. These indicate either a pallet low or pallet high condition. Verify these switches; they should be wired and should work properly.

2.2.9 Pallet Roller Guides

Adjust roller guides to center pallets in unloader Accumulator.

Figure 2.28 ROLLER GUIDES

2.3 RACKVEYOR AND SIDE SHIFTER (LOADER SIDE)

1. Set Two Racks on Rackveyor Indexer.

2. Adjust threaded rod on cap end of cylinder (Figure 2.30, item A) so loader pushers center rack bay with loader center line.

3. Adjust unloader hook plate (Figure 2.30, item B) so unloader pushers center rack bay with unloader center line while the loader rackbay is centered.

4. PRS-105 (Figure 2.29 and Figure 2.30) switch indicates the “forward” position where racks are centered with loader center line and unloader center line. Adjust PRS-105 to tie-plate actuator.

5. PRS-104 (Figure 2.29) switch indicates the “reverse” position to index to next bay. PRS-104 should be adjusted so that carriage hooks tie the next leg of the rack. Adjust PRS-104A to tie-plate actuator.

6. PRS-104A (Figure 2.29) switch indicates carriage is reversing to pick up a new rack when bay is full (only on loader-side shifter). It should be adjusted to go past the first up rack to pick-up a fresh rack (full rack). Adjust PRS-104A to tie-plate actuator.

7. Switches PRS-104, 104A and 105 need to be adjusted 1/4” [6.3mm] from tie plate actuator.

8. LS-110 limit switch (Figure 2.29 and Figure 2.30) indicates rack in position for loader. Should be adjusted to actuate off rack legs.

9. LS-111 limit switch (Figure 2.29) indicates rack in position for unloader. Should be adjusted to actuate off rack legs.

10. When PRS-132 and PRS-133 (Figure 2.29) are both covered by a rack, the indexer strokes to PRS-104A to get new rack. Adjust switches to within 1/4” [6.3mm] from bottom of rack.

11. When PRS-132 is covered and PRS-133 is not, racks will index to PRS-104 for next bay.

12. When neither PRS-132 and PRS-133 are covered by rack, Emitter-100 will be turned on to signal crawler to bring in new rack.

13. PRS-129 (Figure 2.29) indicates that crawler is clear and rack index can take place. This switch should be adjusted to actuate off bottom of crawler (1/4” [6.3mm] below bottom).

14. PRS-127 indicates Side Shifter is in position at Rackveyor. Adjust switch (lateral adjustment) to allow Side Shifter to line up with Rackveyor.

15. LS-123 (Figure 2.31) is located on the Side Shifter. It should be adjusted to actuate off cylinder to indicate locks are unlocked.

16. PRS-121 (Figure 2.31) will indicate the left lock on the Side Shifter is locked up.

17. PRS-122 (Figure 2.31) will indicate the right lock on the Side Shifter is locked up.
Figure 2.29 RACKVEYOR AND SIDE SHIFTER SWITCHES

Figure 2.30 RACKVEYOR
18. PRS-124 (Figure 2.31) indicates that a rack is on the Side Shifter. It should actuate off bottom of rack (1/4” [6.3mm] below).

19. PRS-125 (Figure 2.31) indicates that Crawler is clear of the Side Shifter. Emitter-101 comes on when Side Shifter is locked up at rails and there is a rack on the Side Shifter (PRS-126 and PRS-124 actuated).

2.4 RACKVEYOR AND SIDE SHIFTER (UNLOADER SIDE)

1. Set two racks on Rackveyor indexer.
2. Adjust threaded rod on cap end of cylinder (Figure 2.30, item A) so loader pushers center rack bay with loader center line.
3. Adjust unloader hook plate (Figure 2.30, item B) so unloader pushers center rack bay with unloader center line while the loader rackbay is centered.
4. PRS-105 (Figure 2.29 and Figure 2.30) switch indicates the "forward" position where racks are centered with loader center line and unloader center line. Adjust PRS-105 to tie-plate actuator.
5. PRS-104 (Figure 2.29) switch indicates the "reverse" position to index to next bay. PRS-104 should be adjusted so that carriage hooks the next leg of the rack. Adjust PRS-104A to tie-plate actuator.
6. Switches PRS-104, 104A and 105 need to be adjusted 1/4” [6.3mm] from tie plate actuator.
7. When PRS-132 and PRS-133 (Figure 2.29) are both covered by a rack, the indexer strokes to PRS-104A to get new rack. Adjust switches to within 1/4” [6.3mm] from bottom of rack.
8. PRS-129 (Figure 2.29) indicates that crawler is clear and rack index can take place. This switch should be adjusted to actuate off bottom of crawler (1/4” [6.3mm] below bottom).

9. PRS-127 indicates Side Shifter is in position at Rackveyor. Adjust switch (lateral adjustment) to allow Side Shifter to line up with Rackveyor.
10. PRS-126 indicates Side Shifter is in position at the Crawler rails. Adjust switch (lateral adjustment) to allow Side Shifter to line up with Rackveyor.
11. LS-123 (Figure 2.31) is located on the Side Shifter. It should be adjusted to actuate off cylinder to indicate locks are unlocked.
12. PRS-121 (Figure 2.31) will indicate the left lock on the Side Shifter is locked up.
13. PRS-122 (Figure 2.31) will indicate the right lock on the Side Shifter is locked up.
14. PRS-124 (Figure 2.29) indicates that a rack is on the Side Shifter. It should actuate off bottom of rack (1/4” [6.3mm] below).
15. PRS-125 (Figure 2.29) indicates that Crawler is clear of the Side Shifter. Emitter-101 comes on when Side Shifter is locked up at rails and there is a rack on the Side Shifter (PRS-126 and PRS-124 actuated).
Figure 2.31 SIDE SHIFTER
3.1 MANUAL CONTROLS

Emergency Stop, complete shut off of machine.
Needs to be pulled out to start the machine.

Control Relay Master reset.
Enables the machine to function (emergency button has to be pulled out first).

Loader controls.
To use spade manually, set to HAND then use joystick to move.
To use accumulator manually, set to HAND then use F10 and F11 keys to move up and down.
Unloader controls.
To use spade manually, set to HAND then use joystick to move.
To use accumulator manually, set to HAND then use F10 and F11 keys to move up and down.

Rackveyor controls.
To use manually, set to HAND then use “F” keys as required.

Pallet Unload ON and OFF switch.
Applies power to unloading conveyors and depalleters.

Depalleter Pump ON and OFF switch (if used).

Spade manual control joystick. Operator must set Loader or Unloader to HAND before using.
Operates the loader and unloader spades, UP - DOWN - IN - OUT.

Front Delivery Conveyor ON and OFF switch.
### 3.2 PROGRAMMING KEYS

**Kxx and Fxx Function Keys**
- Use these keys to select a menu.

**0 thru 9, -, . Numeric Key Pad**
- Use these keys to enter numeric values.

**Backspace Key**
- Use this key to erase a parameter.

**Enter Key**
- Use this key to accept a parameter.

**Navigation Keys**
- Use these keys to move cursor up and down and left to right.

**Tab, Shift Keys**

**Esc, Ctrl, Alt Keys**
- Alt+arrow keys activates home, end, page up, page down function keys.
3.3 MAIN MENU

The screens shown in this section are typical screens. Your screens may vary.

NOTE: These man-machine interfaces are dual capable with touch screen and keypad functionality.
3.4 Selection Screen

3.4.1 Loader Off Screen

This screen is displayed when the loader HAND-OFF-AUTO selector switch is set to OFF.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.4.2 Unloader Off Screen

This screen is displayed when the loader HAND-OFF-AUTO selector switch is set to OFF.

**NOTE:** All sensors change color from black to green and blink when actuated.

Touch button or K1 key to view System screen.

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error.

**ACTION MESSAGE:**
To make a manual movement - select unloader hand. To return to automatic - select unloader auto.

Touch button or K1 key to view System screen.

TO OPERATE SELECT UNLOADER HAND OR AUTO

- Touch button or F2 key to view Main Menu screen.
  - Numerically displays the next position to be unloaded.
- Touch button or F5 key to monitor or change parameters on Data Table screen.
- Touch button or F6 key to view or change preset timer values.
- Displays rack bay being unloaded. Touch button to change.
- Touch button or F7 key to view or change preset counter values.
- Touch button or F8 key to view electrical INPUTS and OUTPUT on machine.
- Touch button or F9 key to view Unloader screens.
  - Indicates that all unload positions for a particular bay are empty.
- Touch button or F10 key to view Depalletizer screens.
- Touch button or F11 key to view Rollover screens.
- Touch button or F12 key to view Rackveyor screens.
- Touch button to reset stacker count to full.

Displays the number of pallets in the unloader stacker. Touch button to change.

TURN UNLDR OFF
RETURN TO MAIN MENU
VIEW UNLDR FAULT SCREEN
3.4.3 Rackconveyor* Off Screen

This screen is displayed when the rackconveyor HAND-OFF-AUTO selector switch is set to OFF.
* Rackconveyor and rackveyor are terms that refer to the same equipment.

NOTE: All sensors change color from black to green and blink when actuated.
3.5 AUTOMATIC SCREEN

3.5.1 Loader Auto Control Screen

This screen is displayed only when the loader HAND-OFF-AUTO selector switch is set to AUTO.

**NOTE:** All sensors change color from black to green and blink when actuated.

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error.
3.5.2 Unloader Auto Control Screen

This screen is displayed only when the unloader HAND-OFF-AUTO selector switch is set to AUTO.

**NOTE:** All sensors change color from black to green and blink when actuated.

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error.

**WARNING MESSAGE:**
To indicate that the machine may be waiting in AUTOMATIC for the number of pallets in the block machine to be reduced.

Displays rack bay being unloaded. Touch button to change.
3.5.3 Rackconveyor* Auto Control Screen

This screen is displayed only when the rackveyor HAND-OFF-AUTO selector switch is set to AUTO.

**NOTE:** If you have an unloader side shifter, you will not use PRS-132 and PRS-133. This screen will appear differently.

* Rackconveyor and rackveyor are terms that refer to the same equipment.

**NOTE:** All sensors change color from black to green and blink when actuated.

---

*Touch button or F2 key to view Main Menu screen.*

*Touch button or F4 key to view electrical INPUTS and OUTPUT on machine.*

*Touch button or F5 key to monitor or change parameters on Data Table screen.*

*Touch button or F6 key to view or change preset timer values.*

*Touch button or F7 key to view or change preset counter values.*

*Touch button or K1 key to view System screen.*

*Touch button or F10 key to view Unloader screens.*

*Touch button or F11 key to view Depalleter screens.*

*Touch button or F12 key to view Rollover screens.*

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error.
3.5.4 Depalleter Auto Control Screen

These screens are displayed only when the depalleter HAND-OFF-AUTO selector switch is set to AUTO.

NOTE: All sensors change color from black to green and blink when actuated.
3.5.5 Depalleter #2 Auto Screen

This screen is active only with a 2 depalleter system. This screen is displayed only when depalleter #2 HAND-OFF-AUTO selector switch is set to AUTO.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.5.6 Rollover Auto Control Screen

This screen is displayed only when the rollover HAND-OFF-AUTO selector switch is set to AUTO. This screen is active only when a rollover is in the system.

**NOTE:** All sensors change color from black to green and blink when actuated.

**WARNING MESSAGE:**
To indicate that the machine may be waiting in AUTOMATIC for the number of pallets in the block machine to be reduced.

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error.
3.6 MANUAL CONTROL SCREENS

3.6.1 Loader Hand Control Screen

This screen is displayed only when the loader HAND-OFF-AUTO selector switch is set to HAND.

NOTE: If spade elevates or turns too far and trips a safety switch, the master control relay will drop out. To restart the machine press and hold the CRM reset button and the F6 manual override button. While holding these two buttons, manipulate the joystick to clear the fault.
3.6.2 Unloader Hand Control Screen

This screen is displayed only when the unloader HAND-OFF-AUTO selector switch is set to HAND.

NOTE: All sensors change color from black to green and blink when actuated.
3.6.3 Rackveyor* Hand Control Screen

This screen is displayed only when the rackveyor HAND-OFF-AUTO selector switch is set to HAND.

* Rackveyor and rackconveyor are terms that refer to the same equipment.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.6.4 Depalleter Hand Control Screen

These screens are displayed only when the depalleter HAND-OFF-AUTO selector switch is set to HAND.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.6.5 Depalleter #2 Hand Screen

This screen is active only with a 2 depalleter system. This screen is displayed only when depalleter #2 HAND-OFF-AUTO selector switch is set to HAND.

**NOTE:** All sensors change color from black to green and blink when actuated.

![Depalleter #2 Hand Screen Diagram](image_url)
3.6.6 Rollover Hand Control Screen

This screen is displayed only when the rollover HAND-OFF-AUTO selector switch is set to HAND. This screen is active only when a rollover is in the system.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.7  FAULT SCREENS

3.7.1  Loader Spade Fault Screen

This screen will be updated each time a fault occurs on the loader spade.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.7.2 Unloader Spade Fault Screen

This screen will be updated each time a fault occurs on the unloader spade. Refer to Section 6 “Troubleshooting” for description of all fault screens.

**NOTE:** All sensors change color from black to green and blink when actuated.
3.8 INPUT/OUTPUT STATUS

This typical I/O screen indicates the on or off status of the inputs and outputs being displayed.

![I/O Status 1 Diagram]

Touch button or F2 key to view Main Menu screen.

Touch button or F9 key to view previous screen.

Touch button or K2 key to view previous I/O screen.

Touch button or K12 key to view next I/O screen.
3.9 TIMER ADJUSTMENT

This typical timer screen indicates the preset (programmed) value and current (accumulated) value of the timers being displayed. Values highlighted with red boxes can be modified. Touch the red box to change value.

1.4.2 To Modify a Timer Value

Use K2 or K12 key to select page where desired timer is located.
Once in proper page, touch red box of timer you wish to modify.

Use the \[0\] to \[9\] keys of the pop-up keypad to enter new preset value.

Press \[\leftarrow\] to load the new preset value.
Repeat steps if an error occurs.

Press \[\leftarrow\] to delete left most number.

Press \[\text{ESC}\] to close pop-up keypad.
3.10 PRODUCTION REPORT

This menu informs the operator on the production count. The operator may also reset the production count in this menu.

**NOTE:** It is not possible to reset the total pallet and total rack count.
3.11 DATA TABLE ACCESS

The Data table enables the operator to monitor or change parameters concerning: Control relays, Timer and Counter presets as well as Integer value.

![Full Data Access Screen Diagram]

- **CAUTION - CHANGING DATA COULD CAUSE DAMAGE - BE CAREFUL**
  Authorized use only: Besser is not responsible for any unauthorized use.

- **CAUTION:** CHANGING DATA COULD CAUSE DAMAGE - BE CAREFUL
  Authorized use only: Besser is not responsible for any unauthorized use.
To change or monitor any of the parameters, press any of the touch screen keys between STATUS S2 and FULL INTEGER.

3.11.1 To Monitor SLC500 Status (STATUS S2):

From the FULL DATA ACCESS SCREEN,

1. Press the touch screen key, STATUS S2.

The display will read:

**FULL DATA ACCESS SCREEN**

Authorized use only: Besser is not responsible for any unauthorized use.

---

**Touch Screen Button** - To change value, touch screen here, enter an integer element address, then press ENTER (example here is 10). Refer to logic diagram for address location and description.

---

**Touch Screen Button** - To change value, touch screen here, enter an integer word address, then press ENTER (example here is 0). Refer to logic diagram for address location and description.

---

**Touch Screen Button** - The SLC shows here the Integer word value. To change, touch screen here, enter a value, then press ENTER.
3.12 COUNTER ACCESS

This typical counter screen indicates the preset (programmed) value and current (accumulated) value of the counters being displayed. Values highlighted with red boxes can be modified. Touch the red box to change the value.

3.12.1 To Modify a Counter Access

Use K2 or K12 key to select page where desired counter is located. Once in proper page, touch red box of counter you wish to modify.

Use the 0 to 9 keys of the pop-up keypad to enter new preset value.

Press ← to load the new preset value.

Repeat steps if an error occurs.

Press ← to delete left most number.

Press ESC to close pop-up keypad.
3.13 BESSER-MATIC SETUP SCREEN

To access the Setup screen, display the Main Menu screen and press the F20 key.

NOTE: This is an initial setup screen. It should be accessed only when the equipment is modified.
3.14 INTRANET LINK

This screen shows the typical link selections to the intranet.

Touch button or F1 key to return to the Main Menu.

These buttons are only active if this system is linked to a block plant server computer. When linked, touching these buttons will perform functions indicated.
The following screen appears when the RSLOGIX & INTERNET button is touched on the previous screen.

These buttons are only active if this system is linked to a block plant server computer. When linked, touching these buttons will perform functions indicated.
SECTION 4
OPERATING THE MACHINE

4.1 OPERATING IN AUTOMATIC MODE

If operating the machine for the first time, make sure you have set-up the machine as shown in SECTION 2.

- Pull out the EMERGENCY STOP button.
- Press the CRM button.
- Adjust rack depth and stacker count if necessary. To do so, select Loader and Unloader hand screens (refer to section 3.6).
- Set the Unloader, Loader and Rackveyor switches to AUTO. Refer to Section 3 for switch locations.
- Set the Front Delivery conveyor, Depalleter & pallet return conveyor and rollover selector switches to AUTO.
- Pull out the Pump button to start pump.
- Monitor the Loader or Unloader automatic screen during normal automatic operation. They will indicate rack flow (refer to section 3.5).

4.2 OPERATING IN MANUAL MODE

4.2.1 Operating the Loader in Semi-Auto Mode (also refer to section 3.6.1)

1. Set Loader switch to HAND.
2. Use the joystick on Graphic Control Station to operate the spade. Note that the spade will still automatically turn at center-in/center-out.
3. Touch or press F11 to lower Accumulator shelves.
4. Touch or press F10 to raise Accumulator shelves.

4.2.2 Operating the Unloader in Semi-Auto Mode (also refer to section 3.6.2)

1. Set Unloader switch to HAND.
2. Use the joystick on Graphic Control Station to operate the spade. Note that the spade will still automatically turn at center-in/center-out.
3. Touch or press F11 to lower Accumulator shelves.
4. Touch or press F10 to raise Accumulator shelves.

4.2.3 Operating the Spades in Manual Mode

The manual mode is only used in troubleshooting situation.

For example:

1. Set the Loader or Unloader switch to HAND, which ever you wish to operate manually.
2. Touch or press and hold F8 to turn spade 180° to rack.

WARNING: Spade must only turn at center-in or center-out position, LS-19 or LS-26 tripped.
3. Press and hold F9 to turn spade 180° to Accumulator.

WARNING: Spade must only turn at center-in or center-out position, LS-19 or LS-26 tripped.

NOTE: Touch or press and hold F6 Manual Override button along with the joystick if desired motion does not happen.
4.2.4  Operating the Rackveyor and the Side Shifter in Manual Mode
(also refer to section 3.6.3)
Select the rackveyor screen by touching or pressing the associated (rackv) F key.
1. Set Rackveyor switch to HAND.
2. Touch or press F8 to move rack Indexer forward.
3. Touch or press F9 to move rack Indexer back (reverse).
4. Touch or press F10 to move the Side Shifter forward, towards the Rackveyor.
5. Touch or press F11 to move the Side Shifter to the Crawler rails.
6. Touch or press F13 to [retract] unlock the Side Shifter locks.
7. Touch or press F12 to [extend] lock the Side Shifter locks.

4.2.5  Operating the Depalleter in Manual Mode.
(also refer to section 3.6.4)
Select the depalleter screens by touching or pressing the associated (dep) F key.
1. On the depalleter control station, set the depalleter switch to HAND.
2. Touch or press F9 to move the depalleter forward.
3. Touch or press F11 to raise the pusher.
4. Touch or press F12 to lower the pusher.
5. Touch or press F13 to enable or disable the turntable.
6. You can also use the manual joystick on the depalleter control station.

4.2.6  Operating the Rollover in Manual Mode.
(also refer to section 3.6.6)
Select the depalleter screens by touching or pressing the associated (roll) F key.
1. On the rollover control station, set the rollover switch to HAND.
2. Touch or press F9 to move the rollover forward.
3. Touch or press F5 to move the rollover reverse.
4. You can also use the manual joystick on the rollover control station.

4.2.7  Rackveyor/Side Shifter Speed Adjustment
Speed of the Side Shifter, rail locks and Rack Indexer is controlled through valves located on the equipment.
Speed of each of these components is controlled by two flow controls. One controls the forward movement; the other controls the reverse motion. Turning the flow control counter clockwise will increase speed; turning flow control clockwise will decrease speed.
SECTION 5
MAINTENANCE

Correct maintenance is largely a matter of good judgment on the part of the operator in charge. The Besser-Matic will do the work required with proper maintenance. A good preventive maintenance program based on the recommendations below will extend the machine’s life at a high level of performance.

5.1 BALL JAC MAINTENANCE

5.1.1 General

Ball Screw Jacs with translating screws are fitted with a retainer for one direction of travel only. Its purpose is to avoid inadvertently running the lifting screw out of the jac and losing the balls from the ball nut.

Figure 5.1 EXPLODED VIEW OF A TYPICAL ASSEMBLY (VIEWS ARE ILLUSTRATIVE ONLY)
5.1.2 Lubrication for Gear Box Enclosure

Ball Screw Jacs are shipped with grease in the unit. However, before operating any unit remove the housing plug and check the condition of the lubricant. Lubrication inspection is recommended at regular intervals. Usually one month intervals are satisfactory unless experience indicates that regreasing should occur at shorter or longer intervals.

Each jac unit is furnished with a grease fitting and a pipe plug on opposite sides of the housing.

To lubricate the gear box:

1. Remove the pipe plug.
2. Fill unit with grease until lubricant seeps from the pipe plug opening.
3. Replace pipe plug.

**NOTE:** Severe operating conditions will shorten the lubrication inspection interval.

Lubricate upper bearing through grease fitting as shown in Figure 5.1.

The lubricant should not be corrosive to gears, ball or roller bearings and must be neutral in reaction. The lubricant must not contain any grit or dirt, abrasives or fillers. It should not precipitate sediment, nor separate at temperatures up to 300°F. The lubricant must also have resistance to oxidation and must be non-channeling. We recommend the following extreme pressure greases or equivalents. For operating conditions outside these limits, consult Besser.

<table>
<thead>
<tr>
<th>COMPANY</th>
<th>TRADE NAME</th>
<th>TEMPERATURE RANGE</th>

</thead>
<tbody>
<tr>
<td>Mobil</td>
<td>Mobilux EP#2</td>
<td>-20 to 225°F</td>
</tr>
</tbody>
</table>

Table 5.1 BALL JAC LUBRICANTS

5.1.3 Lubrication for Ball Screw Assembly

In the normal operating range (32°F to 160°F), oil or a good grade of light bearing grease may be used. Grease containing graphite or moly-disulfide should not be used. Use only enough lubricant to maintain a thin, continuous film.

All units are suitable for intermittent operation in ambient temperatures up to 200°F with proper grease. If protective boots are used, the material must be able to withstand the environment.
### 5.1.4 Troubleshooting Tips

Your Ball Jac will perform satisfactorily if suggestions described in this booklet are carefully followed. It is estimated that approximately 98 percent of Ball Jac failures can be attributed to improper lubrication, misapplication, and misalignment.

<table>
<thead>
<tr>
<th>TROUBLE</th>
<th>WHAT TO INSPECT</th>
<th>ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Housing Failure</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1. Unit Overload</td>
<td>Reduce load or replace with unit of sufficient capacity.</td>
</tr>
<tr>
<td></td>
<td>2. Improper Support</td>
<td>Unit should be supported over entire base area, not just at bolt hole locations.</td>
</tr>
<tr>
<td></td>
<td>3. High Shock</td>
<td>Select different material.</td>
</tr>
<tr>
<td></td>
<td>4. Uneven Bolting Torque</td>
<td>Take up evenly on mounting bolts.</td>
</tr>
<tr>
<td>Worm Shaft Failure</td>
<td>1. Type of Coupling</td>
<td>Rigid Couplings can cause shaft failure. Replace with coupling which will provide adequate flexibility and lateral float.</td>
</tr>
<tr>
<td></td>
<td>2. Coupling Alignment</td>
<td>Realign as required.</td>
</tr>
<tr>
<td></td>
<td>3. Presence of Excessive Overhung Load</td>
<td>Check Jac for allowable loads.</td>
</tr>
<tr>
<td></td>
<td>4. Unit Overload</td>
<td>See Housing Failure No. 1.</td>
</tr>
<tr>
<td></td>
<td>5. Shock Loading</td>
<td>Apply coupling capable of absorbing shock and, if necessary, replace with unit of sufficient capacity. Shock loads can significantly increase apparent dead weight loads.</td>
</tr>
<tr>
<td></td>
<td>6. “Ganging” Units</td>
<td>If several units are “in-line”, the worm shaft of the first unit can assume 300% of the rated input torque. If this value is exceeded, you must replace with a larger unit.</td>
</tr>
<tr>
<td>Bearing Failure</td>
<td>1. Unit Overload</td>

*Table 5.2 BALL JAC TROUBLESHOOTING CHART*
5.2 DODGE GEAR BOXES

Besser-Matic uses Dodge Gear Boxes:
- Tigear
- Quantis

Lubrication is extremely important for satisfactory operation. The proper oil level must be maintained in the gearcase at all times.

The satisfactory performance of gears and bearings in gear-motors and reducers depends on clean lubricant, free from dust, grit, sludge, and moisture. Depending on operating conditions, the lubricant will eventually become contaminated and should be replaced periodically.

Please read the manufacturer’s manual for more important maintenance tips.

5.2.1 Tigear C-Face Reducer

The Dodge Tigear speed reducer is a compact wormgear reducer. No vent plug is required.

The C-Face Reducer is the hollow input or “quill mount” type. This reducer is for normal duty applications with input speeds of 2500 rpm and less.

1. Lubrication – The unit is lubricated for life.

   Change oil only when performing maintenance that requires gearbox disassembly. If oil must be replaced, use only Mobil SHC-634.

NOTE: Do not confuse Mobil SHC634 with Mobilgear 634. Mobilgear 634 is an EP type gear oil NOT suitable for use in the Relialube system.

   Fill the gearcase with the proper amount of lubricant as shown in Table 5.3.

</tr>
</tbody>
</table>

   Table 5.3 TIGEAR LUBRICATION AMOUNTS

5.2.2 Quantis

1. Lubrication – Fill with synthetic oil for 20,000 hours of operation.

   Lubricants shown in Table 5.4 are alternates to the standard factory filled lubricant, mineral oil ISO 220. This is not an exclusive recommendation and equivalent lubricants of other manufacturers can be used.

   Do not mix oil of different manufacturers. If a change to another type of oil is made, the lubricant should be drained and the gearcase flushed with clean mineral spirits to avoid any possible compatibility problems.

   Table 5.4 QUANTIS LUBRICANT RECOMMENDATIONS
5.3 CONE DRIVE GEAR BOXES
(2 TURN GEAR MOTORS ON SPADE)

5.3.1 Maintenance

1. The reducer oil level should be checked weekly and the recommended oil added as required to maintain the proper oil level.

2. The oil should be changed as outlined in the lubrication section.

3. All grease fittings should be lubricated with the recommended grease once per month.

4. The reducer, particularly finned areas and fan covers, should be kept clean to allow maximum heat dissipation.

5. All reducer and foundation bolts should be checked for tightness after three (3) months of service and annually thereafter.

6. If a reducer has to be repaired, contact Besser Company for detailed instructions, blueprints, parts lists, etc. If it is necessary, field service is available.

7. If a reducer is to be returned, contact Besser Company for instructions.

5.3.2 Lubrication Data

Lubrication is very important for successful operation of these drives and reducers. Inadequate lubrication can result in increased power consumption, added maintenance and gearset failure. Please review the following recommendations and the manufacturer’s manual. Besser recommends only those lubricants listed in the manufacturer’s manual.

1. TYPE OF OIL

Lubricating oils for use in gear units should be high quality, well-refined, steam cylinder petroleum oils. They must not be corrosive to gears, to ball, roller or sleeve bearings; they must be neutral in reaction; free from grit or abrasive; and have good defoaming properties. As they may be subject to high operating temperatures, they must have good resistance to oxidation.

For worm-gears, additions of 3 percent to 10 percent of acidless tallow or similar animal fats are desirable.

NOTE: If Mobil SHC-634 is used as recommended in the Lubricant chart (section 710) for normal operation (viscosity group 318.62), the time for changing the lubricant may be extended. Drain, flush, and refill after the first 1500 hours of operation; then every 5000 hours thereafter. (SHC is a registered trademark of the Mobil Corporation).

2. AMBIENT TEMPERATURE

The oils shown on the list of approved lubricants shipped with all Cone Drive gearsets and speed reducers are for use in an ambient temperature range of approximately 15° to 100°F [-9° to 38°C] with the low end of the range depending on the pour point of the specific oil used. If the ambient temperature will be below or above this range please contact Besser Company for specific recommendations on proper lubricant as well as proper oil seal and shim materials.

3. SLUDGE

It is necessary that the oil is clean and free from sludge at all times to obtain long life from gear unit.

Sludge in gear units may be caused by excessive heat, from dust and dirt and other contaminates and by the presence of moisture or chemical fumes. Therefore, every precaution should be taken to prevent water and foreign particles from entering the gear case.
4. OIL CHANGE

Oil change should be carried out after 5000 hours of operation or once per year, whichever occurs first. These change intervals are recommended for units operating under favorable conditions. Where operating conditions are severe, such as a rapid rise and fall in temperature of the gear case with accompanied sweating of the inside walls and resulting formation of sludge, or where operation is in moist or dusty atmospheres, or in the presence of chemical fumes or extended running at sump temperatures in excess of 180°F [82°C], it may be necessary to change the oil at intervals of one to three months. It is recommended that a sampling program be established with your lubricant manufacturer or with Besser Company where reducers are exposed to the severe operating conditions, mentioned above.

5. OIL LEVEL

These drive reducers are furnished with a bronze colored hex head pipe plug to indicate oil level. An oil level tag is affixed to the unit near the oil level indicator. Oil level should always be checked with the unit stopped. Estimated oil capacities for standard reducers are listed on the following page.

6. GREASE PACKED BEARINGS

Bearings that are at least partially submerged in oil or oiled by internal oil scoops do not require special maintenance. However, bearings that are not lubricated as above require grease lubrication. Grease fittings and internal retainers are furnished when required. They should be greased with a high quality lithium base NLGI #2 or NLGI #3 bearing grease at normal maintenance intervals.

5.4 TORQUE LIMITER

Figure 5.2  TORQUE LIMITER
(NOT USED ON ALL SYSTEMS)

5.4.2 Torque Adjustment

1. Torque should be adjusted when the accumulator chain starts to slip and the shelves angles do not stop at a precise location as desired. (see Section 4 Initial set-up).

2. To add torque, tighten adjusting bolts (item A in Figure 5.2) equally around load plate until torque limiter holds load and accumulator chain stops perfectly. Tighten bolts equally in small increments. Do not completely flatten the disk springs.

3. When making trial run to test the torque limiter, use fully loaded accumulators.

4. After the final adjustment, lace the adjusting bolts together with the soft steel wire which is supplied with the torque limiter.

5. Maintenance

At periodic intervals, or if desired torque is not maintained, inspect Torque Limiter for presence of oil, grease, moisture, or corrosion on the driving surfaces and for proper setting of spring load. Clean and adjust as required (friction facings and bushings are replaceable parts. Contact Besser Company for part orders).
5.5 **BESCOSHEAR BRAKES**

BescoShear brakes are electrically operated with hydraulic friction plates.

### 5.5.1 Checking the Oil Level

When the brake is installed and weekly thereafter, or until experience dictates otherwise, check the oil level. Always check the oil level with the brake at room temperature and while it is not running.

The BescoShear Motor Brake has an Oil Sight Gauge (#46) to visually check the fluid level. See Figure 5.3 for the location of this sight gauge.

It is located on the side of the End Housing (#9) for horizontal brakes and on the side of the Main Housing (#8) for vertical brakes.

The oil level is to be at the center of this sight gauge (#46) for all models with the drive motor turned off.

### 5.5.2 Operating Temperatures

1. **Ambient Temperature**
   - The standard oil used in the BescoShear Motor Brake was designed to operate in ambient temperatures up to 125°F. If the ambient temperature will fall outside of this range please contact Besser or the manufacturer, Force Control Industries, Inc. for specific recommendations on proper lubricant and oil seals.

2. **Oil Sump Temperature**
   - The maximum recommended oil sump temperature is 200°F.

### 5.5.3 Changing the Oil (See Figure 5.3)

**IMPORTANT:** Always open the disconnects to the drive motor and lock them out before changing the oil.

Every three months completely drain the oil from the brake by removing the drain plug (#64) or the pipe cap (#67). The sight gauge (#46) and air breather (#45) should also be removed and cleaned at this time.

The oil should be changed more frequently when used in harsh environments or high cyclic applications.

#### A. Horizontal and Vertical-Brake Down

1. Remove pipe plug (#64) and drain out all of the oil into a suitable container. Save or discard as condition warrants. Replace the drain pipe plug when finished.
2. Remove the pipe plug (#62) and fill with fresh oil to the center of the sight gauge (#46). Replace the fill pipe plug when finished.

#### B. Vertical-Brake Up

1. Remove pipe cap (#67) and drain out all of the oil into a suitable container. Save or discard as condition warrants. Replace the pipe cap when finished.
2. Remove the pipe plug (#62) and fill with fresh oil to the center of the sight gauge (#46). Replace the fill pipe plug when finished.

**CAUTION:** Do not overfill the brake unit. Excess oil will cause the brake to overheat.

### 5.5.4 Type of Oil

Use only Mobil Automatic Transmission Fluid ATF-210 (Type “F”) or Mobil Multi-Purpose Automatic Transmission Fluid for most drives.

Other fluids may be specified for special applications.

Always use the type of oil specified on the name plate.

---

**Figure 5.3 LUBRICATION**

---
5.5.5 Operational Checks

Make these Operational Checks with the BescoShear Motor Brake shut down and completely assembled with the drive motor attached.

Provisions for manual operation checks must be made if the drive unit has been removed for service and repair. 120 VAC, 60 Hz. electrical service is required to energize the coils. (See Figure 5.4 for the Test Set-Up)

Electrical power is not required to energize the coil. The BescoShear Motor Brake has a normally spring loaded brake when the coil is de-energized.

To check the brake operation:

2. Disconnect the load to the motor.
3. Install a torque wrench on the motor shaft and apply torque. The brake should slip at approximately the static torque of the brake.

To check the brake coil operation:

1. Remove the cover from the Conduit Box.
2. Disconnect the black and white power leads from the Brad-Harrison Cable Connector to “AC In” on Terminal Strip J1 located on the Circuit Board.
3. Connect the test power leads to “AC In” on J1. Turn the On/Off Switch to ON. The Power Indicator Light should come on.
4. Manually turn the Drive Motor Output Shaft. If the shaft turns, then the Brake Coil and Control Circuit are operating properly.

If the shaft does not turn, the brake coil or circuit board is not functioning properly. (See section 5.5.6- Troubleshooting.)

**CAUTION:** Physical damage or malfunction in the motor or brake stack can also prohibit shaft rotation.

6.1 LOADER/UNLOADER SPADE FAULT SCREEN

The Main Menu displays every time a fault occurs on the loader/unloader spade. To view the fault, follow the instruction on the screen. The fault screen displays a series of items to check for troubleshooting. A typical screen is shown here.

Here, the screen informs the operator of the status of the machine. The screen will automatically show a message each time the machine is stopped due to mechanical or electrical error. This explanation will blink if limit switch or proximity switch is faulted.

Touch button or F4 key to reset current fault. Then touch F2 to return to Main Menu.
### 6.2 POSSIBLE MECHANICAL FAULT

Here is a list of possible mechanical problems related to the MS-13/14/16.

APPENDIX A

ELECTRICAL

A.1 DIAGRAMS

Because of different voltages, models and customer's control preferences, we have not included the electrical wiring diagrams, list of materials and electrical information in this manual. The electrical wiring diagrams of your machine and other electrical information (logic) are supplied with your equipment.
