SAFETY BULLETIN

This notice is issued to advise you that some previously accepted shop practices may not be keeping up with changing Federal and State Safety and Health Standards. Your current shop practices may not emphasize the need for proper precautions to insure safe operation and use of machines, tools, automatic loaders and allied equipment and/or warn against the use of certain solvents or other cleaning substances that are now considered unsafe or prohibited by law. Since many of your shop practices may not reflect current safety practices and procedures, particularly with regard to the safe operation of equipment, it is important that you review your practices to ensure compliance with Federal and State Safety and Health Standards.

IMPORTANT

The operation of any machine or power-operated device can be extremely hazardous unless proper safety precautions are strictly observed. Observe the following safety precautions:

⚠ Always be sure proper guarding is in place for all pinch, catch, shear, crush and nip points.
⚠ Always make sure that all personnel are clear of the equipment before starting it.
⚠ Always be sure the equipment is properly grounded.
⚠ Always turn the main electrical panel off and lock it out in accordance with published lockout/tag-out procedures prior to making adjustments, repairs, and maintenance.
⚠ Always wear appropriate protective equipment like safety glasses, safety shoes, hearing protection and hard hats.
⚠ Always keep chemical and flammable material away from electrical or operating equipment.
⚠ Always maintain a safe work area that is free from slipping and tripping hazards.
⚠ Always be sure appropriate safety devices are used when providing maintenance and repairs to all equipment.
⚠ Never exceed the rated capacity of a machine or tool.
⚠ Never modify machinery in any way without prior written approval of the Besser Engineering Department.
⚠ Never operate equipment unless proper maintenance has been regularly performed.
⚠ Never operate any equipment if unusual or excessive noise or vibration occurs.
⚠ Never operate any equipment while any part of the body is in the proximity of potentially hazardous areas.
⚠ Never use any toxic flammable substance as a solvent cleaner.
⚠ Never allow the operation or repair of equipment by untrained personnel.
⚠ Never climb or stand on equipment when it is operational.

It is important that you review Federal and State Safety and Health Standards on a continual basis. All shop supervisors, maintenance personnel, machine operators, tool operators, and any other person involved in the setup, operation, maintenance, repair or adjustment of Besser-built equipment should read and understand this bulletin and Federal and State Safety and Health Standards on which this bulletin is based.

Table B  SUPERPAC ELECTRICAL DATA.

Please consult the table above to find the appropriate electrical data for your SUPERPAC. First, find your corresponding plant power supply in the first left column. You will then find the corresponding electrical data on the same row than your power plant supply.

EX: Your power plant supply is 460V at 60 Hz. According to the table, you will then get these values:

**PLANT POWER SUPPLY:**

460 Volts - 60 Hertz

**TOTAL HORSEPOWER:**

50.5

**TOTAL KILOWATTS:**

37.6

**CONTROL PANEL TRANSFORMER:**

1500 volt-amps

**BRANCH CIRCUIT DISTRIBUTION SWITCH:**

100 amp

**BRANCH CIRCUIT FUSE RECOMMENDED (FRS-R):**

100 amp

**BRANCH CIRCUIT FEEDER RECOMMENDED (THHN):**

4 AWG (21.6mm²)

**BRANCH CIRCUIT FEEDER CONDUIT RECOMMENDED:**

1 in.(25mm)

**SHORT CIRCUIT INTERRUPTING CAPACITY:**

200,000 AIC

Table C  SUMMARY OF ACOUSTICS.
Whenever you have to make adjustments, service the machine, do any kind of checkup or stop production of units, you must lock out the machine. Locking out insures that the machine will not start-up accidentally, thus preventing possible grave injuries. It is a question of safety for all personnel.

When you have to lock out the machine, please follow this procedure:

1. Announce lockout to other employees.
2. Turn power OFF at main panel.
3. Lockout power in OFF position.
4. Put key in pocket.
5. Clear machine of all personnel.
6. Test lockout by hitting run button.
7. Block, chain or release stored energy sources.
8. Clear machine of personnel before restarting machine.

Note: You will also find this procedure on a decal affixed on the machine.
SECTION 2
INTRODUCTION

2.1 HOW A CONCRETE PRODUCT MACHINE WORKS.

The SUPERPAC is a six-at-a-time block machine rated at up to 3240 blocks per hour. A concrete masonry unit is made when concrete is fed into a mold and is then vibrated and compacted. Once it has been compacted, it is stripped out of the mold and delivered onto a conveyor. Many types of molds can be fitted on the machine to obtain a wide variety of products.

Refer to Section 3 MACHINE DESCRIPTION, to learn about the names and locations of the machine’s components.

All of the machine’s movements are controlled by cams located on a main shaft. As the cams turn with the main shaft, they activate rollers which are connected to link rods which in turn are connected to the components. These components either go forward and back or up and down. One cam brings a component forward (or up) and another brings it back (or down). The main shaft is powered by a motor and a clutch. The motor runs all the time. It is the clutch that will stop and start all machine movements. The only operation not activated by the main cam is the block delivery arm which feeds empty pallets to the mold and pallet with blocks to the exit conveyor. This component is powered by a motor and is independent because it sometimes has to keep running while the rest of the machine is stopped.

The pallet has to be lifted at one point in the process; a cam does that. A stripper head frame is also connected to two different cams to move it up and down. A stripper head, which is part of the mold, has to be installed on the stripper head frame. This stripper head will press on top of the units to compact them. A pallet receiver frame is located below the stripper head. This component holds the pallet and the mold in place during the concrete unit forming process (stripper head is pressing and the mold is vibrating). The pallet receiver is connected by links to a cam on the main shaft to move up and moves down through gravity. The last two cams will bring a feed box forward and back. This feed box pushes the material (concrete) to the mold. Concrete will fall into the feedbox through a hopper located on top of the machine. An agitator grid placed in the feedbox will agitate the material as it falls in the mold for better distribution of the concrete. The Agitator is powered by a motor located on the feedbox.

Finally, one motors on each side of the machine vibrate the mold. The vibration occurs when the concrete is fed in by the feedbox and when the units are being compressed by the stripper head. Vibration only lasts a few seconds but it is crucial to making concrete units.
2.2 OPERATOR ORIENTATION

The directions left, right, front and rear, as mentioned throughout this manual are as seen when operator is facing the machine as shown below.

4.1 **3 5/8" HIGH UNITS IN A 3 7/8" HIGH NON-RAMPED MOLD WITH A 14 3/16" HIGH STRIPPER HEAD ASSEMBLY.**

**INITIAL CONDITION:** No mold in the machine.

The following instructions will put the machine in approximate adjustment without the mold in the machine. Final adjustments will be necessary when concrete units are produced. See sections 5 and 6 of this manual.

**Note:** Before adjusting or changing any pin positions, lock-out and tag-out the machine and position the machine in the stripped through position (pallet receiver frame resting on blocking and stripper head frame shock absorbers resting on frame.) Then proceed with caution.

4.1.1 The following items should be positioned as shown in figures 4.1 and 4.2:

- **a. Pallet receiver shaft** - position pins in inside holes (short stroke) (see figure 4.1 below).

---

**CAUTION:** Be sure to mechanically lock out the electrical panel when working on the concrete product machine. Always follow the lockout procedure listed in the **Safety** section of this manual (see section 1)!
Note: A short stroke is needed here since we are making low units.

b. Stripper head shaft (A) - position pins in inside holes (short stroke) (see figure 4.2).

c. Stripper head links (B) - position pins in top holes (see figure 4.2). Adjust links to obtain approximately 7 3/4" [197mm] between link ends.

Figure 4.2  STRIPPER HEAD SHAFT AND LINKS.
4.1.2 Run machine to “first stop” (see figure 4.3.) Turn off clutch and drive motor, and manually lower the auto-ofeed to its lowest position. Disconnect the two auto-ofeed linkages at the top (see figure 4.4).

“First stop” is obtained when the punch marks on the right side outside cam are in line with the roller.

Figure 4.3  “FIRST STOP” (R.H. side of machine).

Figure 4.4  DISCONNECTING THE 2 AUTOFEED LINKAGES.  
(1 of 2 disconnected here)
4.1.3 Adjust the inner frame so that the mold throat is 38 3/8" [975mm] above the top on the base plate (figure 4.5). 0.00" [0mm] of spacers required (no spacers). To do so, follow these procedures.

a. Loosen the "T" clamps on each side of machine that secures machine side plate to mold throat plate. (Figure 4.6)
b. Loosen bolts at all 4 corners that secure mold throat assembly (See figures 4.7 and 4.8). Remove top spacers.

c. Raise mold throat frame up by using hydraulic jack system (figure 4.9) just high enough to allow all lower spacers to be removed at all four corners.

d. Allow hydraulic jack system to slowly lower entire mold throat assembly until supports contact at all 4 corners.

Figure 4.7 BOLTS AT ALL 4 CORNERS (RIGHT SIDE SHOWN).

Figure 4.8 LOOSEN BOLTS.

Figure 4.9 HYDRAULIC JACK SYSTEM.
e. Store spacers on bottom side of bolt for front bolts and left hand rear bolt. For right hand rear bolt store spacers on top. Tighten bolts at all 4 corners that secure mold throat plate spacers (see figure 4.10).

f. Tighten "T" clamps on each side of machine that secures machine side plate to mold throat plate.

4.1.4 Reconnect autofeed linkage and adjust so that the top of the apron plate is 8 3/4" [222mm] above the mold throat at the lowest position of the autofeed (see figure 4.11). To adjust, lower or raise the autofeed until apron plate is in correct position.

Figure 4.10 NO SPACERS.

Figure 4.11 APRON PLATE ABOVE MOLD THROAT ADJUSTMENT.
4.1.5 Install stripping cam insert #320209 on each side of the machine and one stripper head raising cam insert #323058 on the right side of the machine (see figure 4.12).

4.1.6 Adjust the pallet receiver frame so that the pallet receiver rubbers are 2 7/8” [73mm] above the mold throat (see figure 4.13).

Use pallet receiver link rod on both sides of pallet receiver to lower or raise the rubbers as shown in figure 5.14 of page 5.9.

Figure 4.12 CAM INSERTS.

Figure 4.13 PALLET RECEIVER RUBBERS POSITION.
4.1.7 Adjust the upper height stops so that 7 15/16" [202mm] extends past the bottom of the castings as shown on figure 4.14.

4.1.8 Adjust the shock absorbers to a dimension 11 15/16" [303mm] (represented by "A" in figure 4.15) from the bottom of the clamp blocks to the bottom of the rubber pads.
4.1.9 The SUPERPAC is now ready for the installation of the mold assembly. Follow the directions for installing an attachment in section 5 of this manual. When installing the stripper head, insert **4 3/8" [111mm]** of blocking in addition to the **1 1/2" [38mm]** blocks already affixed to the stripper head frame (figure 4.16). The above blocking assumes a stripper head height of **14 3/16" [360 mm]** from the top of the head plate to the bottom of the shoes.

---

**Figure 4.16 4 3/8" [111mm] BLOCKING UNDER STRIPPER HEAD FRAME.**
INITIAL CONDITION: No mold in the machine.

The following instructions will put the machine in approximate adjustment without the mold in the machine. Final adjustments will be necessary when concrete units are produced. See sections 5 and 6 of this manual.

**Note:** Before adjusting or changing any pin positions, lock-out and tag-out the machine and position the machine in the stripped through position (pallet receiver frame resting on blocking and stripper head frame shock absorbers resting on frame.) Then proceed with caution.

4.2.1 The following items should be positioned as shown in figure 4.17 and 4.18:

a. **Pallet receiver shaft** - position pins in inside holes (short stroke) (see figure 4.17 below).

**Note:** A short stroke is needed here since we are making low units.

---

*Figure 4.17 PALLETS RECEIVER SHAFT POSITION.*
b. **Stripper head shaft (A)** - position pins in inside holes (short stroke) (see figure 4.18).

c. **Stripper head links (B)** - position pins in top holes. Adjust links to obtain approximately 7 3/4” [197 mm] (see figure 4.18) between link ends.

---

**Figure 4.18** STRIPPER HEAD SHAFT AND LINKS.
4.2.2 Run machine to "first stop" (see figure 4.19.) Turn off clutch and drive motor, and manually lower the autofeed to its lowest position. Disconnect the two autofeed linkages at the top (see figure 4.20).

"First stop" is obtained when the punch marks on the right side outside cam are in line with the roller.

Figure 4.19 "FIRST STOP" (R.H. side of machine).

Figure 4.20 DISCONNECTING THE AUTOFEED LINKAGES.
(1 of 2 disconnected here)
4.2.3 Adjust the inner frame so that the mold throat is **40 5/8” [1032mm]** above the top on the base plate (figure 4.21). **2 1/4” [57mm]** of spacers are required. To do so, follow these procedures.

a. Loosen the "T" clamps on each side of machine that secures machine side plate to mold throat plate (figure 4.22).

---

**Figure 4.21  INNER FRAME ADJUSTMENT.**

**Figure 4.22  LOOSEN "T" CLAMPS ON BOTH SIDES.**
b. Loosen bolts at all 4 corners that secure mold throat assembly (see figures 4.23 and 4.24). Remove top spacers.

c. Raise mold throat frame up by using hydraulic jack system (figure 4.25) just high enough to allow all lower spacers to be added or removed at all four corners.

d. Allow hydraulic jack system to slowly lower entire mold throat assembly until supports contact at all 4 corners.

Figure 4.23 BOLTS AT ALL 4 CORNERS (RIGHT SIDE SHOWN).

Figure 4.24 LOOSEN BOLTS.

Figure 4.25 HYDRAULIC JACK SYSTEM.
e. Store spacers on bottom side of bolt for front bolts and left hand rear bolt. For right hand rear bolt store spacers on top. Tighten bolts at all 4 corners that secure mold throat plate spacers (see figure 4.26).

f. Tighten “T” clamps on each side of machine that secures machine side plate to mold throat plate.

4.2.4 Reconnect autofeed linkage and adjust so that the top of the apron plate is 8 3/4” [222 mm] above the mold throat at the lowest position of the autofeed (see figure 4.27). To adjust, lower or raise the autofeed until apron plate is in correct position.

Figure 4.27 APRON PLATE ABOVE MOLD THROAT ADJUSTMENT.
4.2.5 Install stripping cam insert #371731 on each side of the machine and one stripper head raising cam insert #371729 on the right side of the machine (see figure 4.28).

4.2.6 Adjust the pallet receiver frame so that the pallet receiver rubbers are 5/8" [16mm] above the mold throat (see figure 4.29).

Use pallet receiver link rod on both side of pallet receiver to lower or raise the rubbers as shown in figure 5.14 of page 5.9.

---

**Figure 4.28** CAM INSERTS.

**Figure 4.29** PALLET RECEIVER RUBBERS POSITION.
4.2.7 Adjust the upper height stops so that 7 11/16" [195mm] extend past the bottom of the castings as shown on figure 4.30.

4.2.8 Adjust the shock absorbers to a dimension 7 7/16" [189mm] (represented by "A" in figure 4.31) from the bottom of the clamp blocks to the bottom of the rubber pads.
4.2.9 The SUPERPAC is now ready for the installation of the mold assembly. Follow the directions for installing an attachment in section 5 of this manual. When installing the stripper head, insert 2 1/8" [54mm] of blocking in addition to the 1 1/2" [38 mm] blocks already affixed to the stripper head frame (figure 4.32). The above blocking assumes a stripper head height of 14 3/16" [360mm] from the top of the head plate to the bottom of the shoes.

Figure 4.32  2 1/8" [54mm] BLOCKING UNDER STRIPPER HEAD FRAME.
4.3 80 MM HIGH UNITS IN A 86 MM HIGH NON-RAMPED MOLD WITH A 360 MM HIGH STRIPPER HEAD ASSEMBLY.

INITIAL CONDITION: No mold in the machine.

The following instructions will put the machine in approximate adjustment without the mold in the machine. Final adjustments will be necessary when concrete units are produced. See sections 5 and 6 of this manual.

Note: Before adjusting or changing any pin positions, lock-out and tag-out the machine and position the machine in the stripped through position (pallet receiver frame resting on blocking and stripper head frame shock absorbers resting on frame.) Then proceed with caution.

4.3.1 Run machine to "first stop" (see figure 4.33). Turn off clutch and drive motor and manually lower the autofeed to its lowest position. Disconnect the two autofeed linkages at the top (see figure 4.34).

“First stop” is obtained when the punch marks on the right side outside cam are in line with the roller.

Figure 4.33  "FIRST STOP" (R.H. side of machine).

Figure 4.34  DISCONNECTING THE AUTOFEED LINKAGES.
(1 of 2 disconnected here)
4.3.2 Adjust the inner frame so that the mold throat is **1057mm [41.625”]** above the top on the base plate (figure 4.35). **83mm [3.25”]** of spacers are required. To do so, follow these procedures.

a. Loosen the "T" clamps on each side of machine that secures machine side plate to mold throat plate (figure 4.36).
b. Loosen bolts at all 4 corners that secure mold throat assembly (See figure 4.37 and 4.38). Remove top spacers.

c. Raise mold throat frame up by using hydraulic jack system (figure 4.39) just high enough to allow all lower spacers to be removed or added at all four corners.

d. Allow hydraulic jack system to slowly lower entire mold throat assembly until supports contact at all 4 corners.
e. Store spacers on bottom side of bolt for front bolts and left hand rear bolt. For right hand rear bolt store spacers on top. Tighten bolts at all 4 corners that secure mold throat plate spacers. (See figure 4.40).

f. Tighten "T" clamps on each side of machine that secures machine side plate to mold throat plate.

4.3.3 Reconnect autofeed linkage and adjust so that the top of the apron plate is **222mm [8 3/4"]** above the mold throat at the lowest position of the autofeed (see figure 4.41). To adjust, lower or raise the autofeed until apron plate is in correct position.

Figure 4.40 83mm [3 1/4"] OF SPACERS.

Figure 4.41 APRON PLATE ABOVE MOLD THROAT ADJUSTMENT.
4.3.4 Remove the stripping cam insert from each side of the machine. This concrete unit is run without any stripping cam insert (see figure 4.42).

4.3.5 The following items should be positioned as shown on figures 4.43 and 4.44.

a. Pallet receiver shaft - position pins in inside holes (short stroke)(see figure 4.43).
b. Stripper head shaft (A) - position pins in inside holes (short stroke) (see figure 4.44).

c. Stripper head links (B) - position pins in top holes. Adjust links to obtain approximately 105mm [4 1/8"] between link ends (see figure 4.44).

Figure 4.44 STRIPPER HEAD SHAFT AND LINKS.
4.3.6 Run machine to “first stop.” Turn off clutch and drive motor, and adjust the pallet receiver links to obtain a dimension of 1143mm [45"] from the top of the base plate to the tops of the pallet receiver rubbers (see figure 4.45). This adjustment should expose approximately 600mm [23 5/8"] of link rod between the upper link end and the boss on the spring assembly (see dimension “A” on figure 4.46).

Figure 4.45 PALLET RECEIVER RUBBERS ABOVE BASE PLATE.

Figure 4.46 LINK ROD.
4.3.7 Adjust the upper height stops (part #047356) so that **170mm [6.675"]** extend past the bottom of the castings (figure 4.47).

4.3.8 Install the **445mm (18 1/2")** shock absorbers (part #282177). Adjust the shock absorbers to a dimension of **300mm [11.812"]** (represented by "A" in figure 4.48) from the bottom of the welded clamp block to the bottom of the rubber pad.

4.3.9 Install sheave (part #112339F2075) on the drive motor.

![Figure 4.47 UPPER HEIGHT STOPS.](image1)

![Figure 4.48 INSTALLING SHOCK ABSORBERS AND ADJUSTING.](image2)
4.3.10 The SUPERPAC is now ready for the installation of the mold assembly. Follow the directions for installing an attachment in section 5 of this manual. When installing the stripper head use 279mm [11"] long bolts (part #087136) and insert 95mm [3 3/4"] of blocking in addition to the 38mm [1 1/2"] blocks already affixed to the stripper head frame (figure 4.49).

Figure 4.49 95mm [3 3/4"] BLOCKING UNDER STRIPPER HEAD FRAME.
4.4 60mm HIGH UNITS IN A 67mm HIGH NON-RAMPED MOLD WITH A 360mm HIGH STRIPPER HEAD ASSEMBLY.

INITIAL CONDITION: No mold in the machine.

The following instructions will put the machine in approximate adjustment without the mold in the machine. Final adjustments will be necessary when concrete units are produced. See sections 5 and 6 of this manual.

CAUTION: Be sure to mechanically lock out the electrical panel when working on the concrete product machine. Always follow the lockout procedure listed in the Safety section of this manual (see section 1)!

Note: Before adjusting or changing any pin positions, lock-out and tag-out the machine and position the machine in the stripped through position (pallet receiver frame resting on blocking and stripper head frame shock absorbers resting on frame.) Then proceed with caution.

4.4.1 Run machine to "first stop" (see figure 4.50). Turn off clutch and drive motor and manually lower the autofeed to its lowest position. Disconnect the autofeed linkage at the top (see figure 4.51).

"First stop" is obtained when the punch marks on the right side outside cam are in line with the roller.

Figure 4.50  "FIRST STOP" (R.H. side of machine).

Figure 4.51  DISCONNECTING THE AUTOFEED LINKAGES.
(1 of 2 disconnected here)
4.4.2 Adjust the inner frame so that the mold throat is 1038mm [40.875"] above the top on the base plate (figure 4.52). 63mm [2 1/4"] of spacers required. To do so, follow this procedure.

a. Loosen the "T" clamps on each side of machine that secures machine side plate to mold throat plate. (figure 4.53).

---

Figure 4.52 INNER FRAME ADJUSTMENT.

Figure 4.53 LOOSEN "T" CLAMPS ON BOTH SIDES.
b. Loosen bolts at all 4 corners that secure mold throat assembly (figure 4.54 and 4.55). Remove top spacers.

c. Raise mold throat frame up by using hydraulic jacks system (figure 4.56) just high enough to allow all lower spacers to be removed or added at all four corners.

d. Allow hydraulic jack system to slowly lower entire mold throat assembly until supports are together at all 4 corners.

Figure 4.54 BOLTS AT ALL 4 CORNERS. (RIGHT SIDE SHOWN)

Figure 4.55 LOOSEN BOLTS.

Figure 4.56 HYDRAULIC JACK SYSTEM.
e. Store spacers on bottom side of bolt for front bolts and left hand rear bolt. For right hand rear bolt store spacers on top. Tighten bolts at all 4 corners that secure mold throat plate spacers (see figure 4.57).

f. Tighten "T" clamps on each side of machine that secures machine side plate to mold throat plate.

4.4.3 Reconnect autofeed linkage and adjust so that the top of the apron plate is **222mm [8 1/4"]** above the mold throat at the lowest position of the autofeed (see figure 4.58). To adjust, lower or raise the autofeed until apron plate is in correct position.

---

Figure 4.58 APRON PLATE ABOVE MOLD THROAT ADJUSTMENT.

Figure 4.57 63mm (2 1/2") OF SPACERS.
4.4.4 Remove the stripping cam insert from each side of the machine. This concrete unit is run without any stripping cam inserts (see figure 4.59).

4.4.5 The following items should be positioned as shown on figures 4.60 and 4.61:

a. Pallet receiver shaft - position pins in outside holes (long stroke)(see figure 4.60).

---

**Figure 4.59** STRIPPING CAM INSERTS.

**Figure 4.60** PALLET RECEIVER SHAFT POSITION.
b. Stripper head shaft (A) - position pins in inside holes (short stroke) (see figure 4.61).

c. Stripper head links (B) - position pins in top holes. Adjust links to obtain approximately 105mm (4 1/8") between link ends (see figure 4.61).

Figure 4.61 STRIPPER HEAD SHAFT AND LINKS.
4.4.6 Run machine to “first stop.” Turn off clutch and drive motor, and adjust the pallet receiver links to obtain a dimension of 1143mm [45"] from the top of the base plate to the tops of the pallet receiver rubbers (see figure 4.62). This adjustment should expose approximately 600mm [23 5/8"] of link rod between the upper link end and the boss on the spring assembly (see dimension “A” on figure 4.63).

Figure 4.62 PALLET RECEIVER RUBBERS ABOVE BASE PLATE.

Figure 4.63 LINK ROD.
4.4.7 Adjust the upper height stops (part #047356) so that 170mm [6.675"] extend past the bottom of the castings (figure 4.64).

4.4.8 Install the 470mm [18 1/2"] shock absorbers (part #282177). Adjust the shock absorbers to a dimension of 300mm [11.812"] (represented by "A" in figure 4.65) from the bottom of the welded clamp block to the bottom of the rubber pad.
4.4.9 The SUPERPAC is now ready for the installation of the mold assembly. Follow the directions for installing an attachment in section 5 of this manual. When installing the stripper head use 279 mm (11") long bolts (part #087136) and insert 95mm [3 3/4"] of blocking in addition to the 38mm [1 1/2"] blocks already affixed to the stripper head frame (figure 4.66).

Figure 4.66 95mm (3 3/4") BLOCKING UNDER STRIPPER HEAD FRAME.
SECTION 5
MOLD & STRIPPER HEAD INSTALLATION

NOTE: AS AN INITIAL CONDITION, IT IS ESSENTIAL YOU REVIEW SECTION 4 “MACHINE SET UP FOR SPECIFIC MOLD” BEFORE GOING THROUGH THIS SECTION.

5.1 BESSER MOLD ASSEMBLY & TORQUE REQUIREMENTS.

Longer mold life can be achieved by observing a few basic rules. Be sure to clean all parts and mating surfaces thoroughly before assembly. Always be sure parts are properly aligned and use proper torque requirements. To assure that parts are square, start with a good working surface (mold jig). A visual inspection is suggested to make sure parts are not burred or scored.

Note: Always start with new lock washers and use only a brass hammer.

Note: Use an adequate torque wrench to tighten at the proper torque.

5.1.1 Outside division plates should be torqued to 625 - 675 LB-FT, (930 - 1005 N-M). Outside division plates with cutouts for face liners should be torqued to 175 - 195 LB-FT (260 - 290 N-M).

5.1.2 Threaded inside division plates should be torqued to 40 - 50 LB-FT, (60 - 70 N-M). Tanged inside division plates should be torqued to 100 - 120 LB-FT, (150 - 180 N-M).

5.1.3 End liners should be torqued to 100 - 140 LB-FT, (150 - 210 N-M).

5.1.4 Core bars should first be fitted initially front and back.

5.1.5 Core bars should be torqued to 70 - 90 LB-FT, (105 - 135 N-M). Align front and back as uniformly as possible to the mold side bars. Check cores for center between division plates to assure uniformly block dimensions. (A wire can be secured through the hold down bolt heads as a safety to prevent the bolts from coming loose during constant vibration.)

5.1.6 Vibrator bolts should be torqued to 220 - 300 LB-FT, (330 - 450 N-M).

5.1.7 Stripper shoes should be torqued to 65 - 75 LB-FT, (100 - 110 N-M).

5.1.8 Align the stripper shoes.

5.1.9 Secure plungers to stripper head plate - 100 - 140 LB-FT, (150 - 210 N-M).

5.1.10 Center vibrator weights as close as possible to assure uniform vibration and that the nuts face towards the outside of the mold. Double weights should be located 0.5" [12.5mm] from edge of bearing enclosure.

Note: If the machine is equipped with optional Smartpac vibration system, vibrator weights are factory-positioned on shaft.

5.2 JOGGING AND RUNNING THE MACHINE.

There is two ways to operate the machine: you can jog it, or simply run it. Run the machine when you want to cycle it. Jog the machine when you want to stop the machine at a precise position. All controls to jog or run the machine are located on the Graphic Control Station (please refer to section 9 for more details).

1. To run the machine, follow this procedure:
   A) Push the "MAIN DRIVE START" button.
   B) With the main drive running, turn the "CLUTCH" selector switch to "ON". The machine starts cycling.

2. To jog the machine, follow this procedure:
   A) Turn the "CLUTCH" selector switch to "JOG".
   B) Depress and release the "JOG" button to move the machine gradually as the main drive is functioning.
5.3 REMOVING A MOLD

Follow this step by step procedure in order to remove a mold and stripper head from a SUPERPAC.

5.3.1 Run machine to “first stop” (feed box all the way forward). See figure 5.1.

5.3.2 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.3.3 Remove cut off bar and agitator grid.

5.3.4 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button and start drive motor.

DANGER: Always turn power off and mechanically lock out electrical panel before working on Concrete Product Machine. Always follow the safety tips listed in the Safety section of this manual (see section 1). During the course of the following procedure, you will be asked to periodically turn power off and lock out machine. It is important you do so for your safety and the safety of personnel working on the SUPERPAC!

WARNING: No one should be standing next to machine when running machine to “first stop”. Feed box coming forward is dangerous and could lead to serious injuries!

5.3.5 Run machine to “third stop”. (Stripper head frame and pallet receiver frame all the way down.

5.3.6 Turn clutch to “JOG” until stripper head is high enough above mold to insert blockings inside mold.

5.3.7 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.3.8 Put 2 X 4’s wooden blockings in mold as shown in figure 5.2. Use two pieces of 2” x 4” x 8” wood blocking, and one piece of 2” x 4” x 7-1/2” to assure a space between stripper head plate and mold top plate. Use the 8” blockings in the rear corners and the 7-1/2” blocking in the front center to clear bolt holes in the stripper head top plate.

Figure 5.1 “FIRST STOP” (R.H. side of machine).
5.3.9 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button. **Do not** start main drive motor.

5.3.10 Jog machine until stripper head frame is resting on 2 X 4’s blockings. Weight of stripper head will turn machine in reverse.

5.3.11 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, **lock out** machine.

5.3.12 Remove bolts holding the head assembly (figure 5.3).

5.3.13 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button.

5.3.14 Jog machine to bring stripper head high enough to connect safety chain (figure 5.4).

5.3.15 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, **lock out** machine.

---

**Figure 5.2** WOODEN BLOCKINGS IN MOLD.

**Figure 5.3** REMOVING BOLTS FROM BOLT STRIPPER HEAD PLATE.
5.3.16 Hook safety chain as shown in figure 5.4.

5.3.17 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button. Do not start main drive motor.

5.3.18 Jog clutch until stripper head comes down and is supported by safety chain.

5.3.19 Keep jogging until pallet receiver is at lowest position.

5.3.20 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

Figure 5.4  ATTACHING STRIPPER HEAD FRAME WITH SAFETY CHAIN.
5.3.21 Disconnect vibrator shaft hose from dump valve and cap (on Smartpac vibration system only).

5.3.22 Lift up vibrator guards.

5.3.23 Raise both vibrator motors with screw jacks (C) (see figure 5.5).

5.3.24 Remove V-belts from vibrating motor sheaves to vibrating shaft sheaves.

5.3.25 Open mold locks (left and right) as shown in figure 5.6.

Figure 5.5 RAISING THE VIBRATOR MOTORS WITH SCREW JACK (C).

Figure 5.6 MOLD LOCKS IN OPEN POSITION (LEFT LOCK SHOWN).
5.3.26 If your machine is equipped with a Mold Insertion Device, push carriages under shaft assembly of mold. Then raise carriage to carry position using the hand control. Figure 5.7 shows the Mold Insertion Device in its lower position.

5.3.27 Pull mold forward.

5.3.28 Chain mold as shown in figure 5.8.

5.3.29 Remove mold. We recommend the use of an overhead crane.

**CAUTION:** Molds are heavy pieces of equipment. Handle with extreme care.

---

**Figure 5.7** MOLD INSERTION DEVICE IN LOWER POSITION.
This figure has been simplified for illustration purposes.

**Figure 5.8** MOLD IS CHAINED, READY TO BE TAKEN OUT OF MACHINE.
5.4 INSTALLING THE MOLD

**DANGER: Always** turn power off and mechanically lock out electrical panel before working on Concrete Product Machine. **Always** follow the safety tips listed in the Safety section of this manual (see section 1). During the course of the following procedure, you will be asked to periodically turn power off and lock out machine. It is important **you do so** for your safety and the safety of personnel working on the SUPERPAC!

A. Preparing the machine for the mold

5.4.1 Starting with machine in a stripped through position, both the pallet receiver frame and the stripper head frame are all the way down. Mold locks are in closed position and latched.

5.4.2 Jog the machine until the stripper head is high enough to hook up safety chain but before the feedbox starts forward (figure 5.9).

5.4.3 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.4.4 Hook safety chain to stripper head frame (see figure 5.9).

**DANGER: Do not** go on with this procedure without hooking safety chain to stripper head frame!

5.4.5 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button. **Do not** start main drive motor.

5.4.6 Jog the machine to lower the stripper head so it hooks on the safety chain. The pallet receiver will lower. When it is low enough to allow easy mold change without interference with pallet receiver, that is sufficient.

5.4.7 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, **lock out machine**.

**Note:** Sometimes the main drive pulley (ref. page 2.5) may have to be manually rotated clockwise to allow the pallet receiver to lower. To do so, the motor should be stopped and the clutch on.

Figure 5.9  ATTACHING STRIPPER HEAD FRAME WITH SAFETY CHAIN.
5.4.8 Open mold locks as shown in figure 5.10 below (one on each side).

5.4.9 Place stripper head down in mold using two pieces of 2” x 4” x 8” wood blocking, and one piece of 2” x 4” x 7-1/2” to assure a space between stripper head plate and mold top plate. Use the 8” blockings in the rear corners and the 7-1/2” blocking in the front center to clear bolt holes in the stripper head top plate (see figure 5.11).

**Note:** Make sure the cutoff bar and the agitator grid have been removed before putting a mold in the machine!

**CAUTION:** Stripper heads are heavy pieces of equipment. Handle with extreme care.

---

**Figure 5.10** MOLD LOCKS IN OPEN POSITION (LEFT LOCK SHOWN).

**Figure 5.11** STRIPPER HEAD POSITIONED IN MOLD.
5.4.10 Chain mold with stripper head as shown in figure 5.12 below. We recommend the use of an overhead crane. The weight of a complete mold is approximately 6000 lbs [2727 Kg].

Mold is now ready to be placed in machine.

Figure 5.12  MOLD IS CHAINED, READY TO BE PLACED IN MACHINE.
B. Placing mold and stripper head in machine without the use of the optional Mold insertion device.

5.4.11 Place mold and stripper head in machine (see figure 5.13), back against mold throat liners (E) (see figure 5.13b).

5.4.12 Close mold locks (A) and latch (B) (see figure 5.13b).

5.4.13 Loosen the clamp bolt (C) (see figure 5.13b).

5.4.14 Tighten the bolt (D) hand tight and then back off 1/4 of a turn (see figure 5.13b).

5.4.15 Tighten the clamp bolt (C) (see figure 5.13b).

---

Figure 5.13b SECURING THE MOLD.

Figure 5.13 PLACING MOLD AND STRIPPER HEAD IN MACHINE.
NOTE: This figure has been simplified for illustration purposes.
5.4.16 Raise both vibrator motors with screw jacks (C) (see figure 5.14). Screw vibrators jacks up and place V-belts from vibrating motor sheaves to vibrating shaft sheaves. On a standard vibration system, you must install 4 belts on each side. On a Smartpac system, you must install 2 belts on each side.

5.4.17 Lower right hand vibrator motor, then left hand vibrator motor to tighten belts. Make sure sheaves are aligned. Lower jack screws to cotter pins.

5.4.18 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button and start main drive motor.

5.4.19 Jog machine to raise the stripper head frame just high enough to disconnect safety chain.

5.4.20 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.4.21 Disconnect safety chain, and hang it on chain hook.

5.4.22 Turn power back on. Do not start main drive motor. Turn clutch switch to the “Jog” position and push the “Jog” button to allow the stripper head frame to lower to the top of stripper head plate.

5.4.23 Bolt stripper head plate to stripper head frame. Do not tighten bolts completely. Tighten until head plate contacts the stripper head frame (see figure 5.15).

5.4.24 Place a good pallet on the pallet receiver rubbers.

---

![Figure 5.14 RAISING THE VIBRATOR MOTORS WITH SCREW JACK (C).](image)

**WARNING:** Do not raise the stripper head frame too high; otherwise the feedbox will come forward resulting in crush hazard!
5.4.25 Start main drive motor. Jog machine to raise stripper head just high enough to remove 2"x4" blocking from under stripper head plate.

5.4.26 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.4.27 Remove the rear blocks first, then remove the front block.

5.4.28 Make sure no one is standing on or near machine and turn power back on. Hit MCR reset button.

5.4.29 Cycle machine to “first stop” position (feedbox all the way to the front), turn clutch switch off and stop drive motor. At this point the mold and pallet should be on the pallet receiver rubbers (see figure 5.16).

---

Figure 5.15 BOLT STRIPPER HEAD PLATE TO STRIPPER HEAD FRAME.

Figure 5.16 MOLD RESTING ON THE PALLET RECEIVER.
5.5 ADJUSTING THE MOLD

A. Levelling the mold

5.5.1 Run machine to “first stop” (feedbox all the way forward) (see figure 5.1).

5.5.2 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.5.3 Check level of mold from side to side and from front to back until bottoms of mold side bars are approximately 5/8” [16mm] above mold throat plates at all four check points (see figure 5.17).

5.5.4 If the dimension on each side is not approximately 5/8” [16mm], adjustment must be made using the pallet receiver link rods (B) (see figure 5.18, next page), after loosening nut (A) (see figure 5.18).

5.5.5 Turn power back on and vibrate mold.

5.5.6 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.5.7 Check level of mold from side to side and from front to back until bottoms of mold side bars are 5/8” [16mm] above mold throat plates at all four check points (see figure 5.17).

Figure 5.17 SIDE TO SIDE DIMENSION (3 of the 4 check points shown).
5.5.8 If the dimension on each side is not 5/8" [16mm], adjustment must be made using the pallet receiver link rods (B) (see figure 5.18), after loosening nut (A) (see figure 5.18).

5.5.9 Turn power back on and vibrate mold again.

5.5.10 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, **lock out** machine.

5.5.11 Recheck level of mold and adjust following steps 5.5.3 to 5.5.5 until mold is perfectly levelled. Tighten nut (A) (see figure 5.18).

Figure 5.18 PALLET RECEIVER LINK ROD (LEFT SIDE SHOWN).
5.5.12 If the dimension in front and back is not 5/8" [16mm], carry out adjustment by first checking clearance of bottom guide liners on both sides of the machine. If clearance is off, tighten front screw hand tight and then back off 1/4 of a turn balancing out both guide liner adjusting screws. These screws are located at the bottom of the pallet receiver frame at the slide shaft on both sides of the machine.

A. To make the following adjustments (see figure 5.19):

1. Loosen the nut (A).
2. Adjust the guide liner (B) as desired.
3. Tighten the nut (A).

5.5.13 Make adjustments on right hand side by backing one guide liner away from slide shaft and tightening the other against the slide shaft. To raise the front, loosen the front and tighten the back. To raise the back, loose the back and tighten the front. See figure 5.20 below.

5.5.14 After 5/8" [16mm] adjustment is obtained, go back to the left hand side of the machine and retighten loosened guideliner adjusting screws. Then back rear screw 1/4 of a turn so this guide liner will move freely.

5.5.15 Vibrate between each adjustment. Turn clutch off and power off before checking dimensions and/or making adjustments.

Figure 5.19 UPPER GUIDE LINER ADJUSTMENT SCREW.

Figure 5.20 PALLET RECEIVER FRAME ADJUSTMENT.
B. Mold lateral adjustment:

**Note:** The mold and pallet are supported by the pallet receiver frame.

5.5.16 Vibrate mold.

5.5.17 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, **lock out** machine.

5.5.18 Check for centered position in machine. Mold is centered when mold side bars are approximately 1" [25.4mm] between vibrator bearing blocks and the inside of mold throat plates (see figures 5.21 and 5.22).

**Note:** The 1" [25.4mm] wide gooseneck pry bar (part #61397) works nicely for mold centering.

---

**Figure 5.21 CENTERING THE MOLD.**

**Note:** This figure has been simplified for illustration purposes.

**Figure 5.22 USING THE 1" [25.4mm] DIMENSION TO CENTER THE MOLD.**
5.5.19 Loosen clamp bolt (A) (see figure 5.23).

5.5.20 Turn adjusting screw (B) up until it contacts under side of right hand vibrating motor support plate (see figure 5.23). The adjusting screw (B) is located under the right vibrating motor.

5.5.21 Turn power back on. Hit MCR reset button.

5.5.22 Vibrate mold.

5.5.23 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.5.24 Recheck 1” dimension. During vibration, if mold works off center to the right, turn adjusting screw (B) up (see figure 5.23) which will move the vibrating motor up. If molds works off center to the left, turn adjusting screw (B) down (see figure 5.23).

Note: Make sure base is not on the jacking screw (C) when adjusting vibrating motor height (see figure 5.23).

5.5.25 Repeat step 5.5.24 if necessary, until mold automatically remains centered. No adjustment is required on left hand vibrating motor. Equal belt tension is automatically maintained.

5.5.26 Tighten clamp bolt (A).

---

Figure 5.23  VIBRATING MOTOR HEIGHT ADJUSTMENT SCREW (B).
5.6 APRON PLATE ADJUSTMENT

5.6.1 Adjust so the apron plate is 1/8" [3mm] above the mold top plate (figure 5.25) with the machine at “first stop”.

WARNING: The following procedure must be done with power off and machine locked-out!

Note: 1/8" [3mm] is a good reference provided the feedbox does not contact the mold during vibration.

5.6.2 Check to see that there is approximately 1/32" [0.8mm] clearance between the apron plate and the back of the mold top plate (see figure 5.24 and 5.25).

5.6.3 If necessary, adjust apron plate. Loosen bolts and move forward or back (see figure 5.26).

Figure 5.24 APRON PLATE CLEARANCE.

Figure 5.25 APRON PLATE CLEARANCE.
Figure 5.26  APRON PLATE ADJUSTMENT (FORWARD TO BACK).
5.6.4 Run machine to “first stop” (feed box all the way forward). See figure 5.1.

5.6.5 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.6.6 Measure from bottom of shoe to top of mold end liners (see figure 5.27). Add dimension “C” to this measurement (dimension “C” is the amount of compression. For detailed explanations, see section 5.8)

5.6.7 Loosen nuts (A) and set height pins (B) to be this far away – the final result of the measurement in 5.6.6 – from lower height stops (figure 5.28).

Figure 5.27 SHOES 4” [102MM] ABOVE MOLD.

Figure 5.28 HEIGHT PINS ADJUSTMENT (LEFT SIDE SHOWN).
5.7 ADJUSTING STRIPPER HEAD

5.7.1 Run machine to “first stop” (feed box all the way forward). See figure 5.1.

5.7.2 To determine if the head is level with mold (left to right and front to back), measure how far the bottom of the stripper shoes are above the mold end liners at all 4 corners (A, B, C and D) (see figure 5.30).

5.7.3 If the head is not levelled side to side (A to B) (see figure 5.30), adjust the left hand stripper head adjusting link (see figure 5.29).

Figure 5.29  L.H. STRIPPER HEAD LINK.

Figure 5.30  STRIPPER SHOES POSITION.
5.7.4 If the stripper head is not level (B to C) (see figure 5.30) with the mold from front to back, back out both lower guide liner adjusting screws on the stripper head frame at the slide shaft on the left hand side of machine (see figure 5.31). Loosen nut (A) and adjust with bolt (B).

5.7.5 Make adjustment on the right hand side by backing one lower stripper head guide liner away from the slide shaft and tightening the other against the slide shaft. To raise the front, loosen rear and tighten front. To raise the back, loosen the front and tighten the rear (see figure 5.32).
5.7.6 After head is level with mold, tighten both adjustment screws against the slide shaft on the left hand side (see figure 5.31). Then loosen the front adjustment screws 1/4 of a turn and tighten clamp bolts.

5.7.7 Turn power back on. Hit MCR reset button.

5.7.8 Turn height pins OFF. Jog machine to “second stop” (Ref. section 7.3). Stripper shoes should be in mold and height pins should touch.

5.7.9 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.7.10 Adjust bottom of shock absorbers to pads to dimension of unit height plus 3/4” [19mm].

5.7.11 Put in agitator grid and cut-off bar, and check feedbox alignment. There should be a minimum clearance of 1/4” [6mm] between the wiper assembly and the stripper shoe as shown in figure 5.33.

Note: For units higher than 3 5/8”, clearance with stripper head plate must also be maintained.

5.7.12 If adjustment is necessary, adjust the feedbox linkages (see figure 5.34).

---

Figure 5.33 FEEDBOX ADJUSTMENT.

Figure 5.34 FEEDBOX LINKAGE.
5.7.13 Turn power back on. Hit MCR reset button.

5.7.14 Make sure that machine is at “second stop” (Ref. section 7.3).

5.7.15 Shut off clutch.

5.7.16 Turn vibrator switch to “hand” position for 5 seconds.

| WARNING: Make sure guards are in place over vibrator belts! |

5.7.17 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.7.18 Tighten the head bolts (figure 5.35).

5.7.19 Turn height pins ON.

Figure 5.35  TIGHTENING THE HEAD BOLTS.
5.8 COMPRESSION CALCULATION

5.8.1 To correctly evaluate the amount of compression needed from the stripper head to make units of the desired height, the operator must use the following equation:

\[ \text{SAL} = \text{UH} - \text{MH} + \text{ST} \]

In this equation, UH represents Unit Height, MH is Mold Height and SST is Stripper Shoes Thickness. The result, SAL, is the height of the stripper Shoes Above end Liners.

Figure 5.36 will help you visualize the equation. Letters A, B and D represents respectively unit height, mold height and stripper shoes thickness.

Letter E is the height of the stripper shoes above end liners (letter C is the amount of compression).

EX: Suppose the operator wants to make 7 5/8" [194mm] high units in a 8 1/4" [209mm] high mold with stripper shoes of 1 1/2" [38mm] thickness. The operator gets a result of 7/8" [23mm] for the height of stripper shoes above end liners:

\[ 7 \ 5/8" - 8 \ 1/4" + 1 \ 1/2" = 7/8" \]

Or, in millimeters:

\[ 194\text{mm} - 209\text{mm} + 38\text{mm} = 23\text{mm} \]

Figure 5.36 MOLD AND STRIPPER HEAD DIMENSIONS FOR HEIGHT PINS ADJUSTMENTS.
5.9 SPRING OPENING ADJUSTMENT

5.9.1 Turn height control "ON", jog the machine until the bottom of the mold side bars set down on the machine side frame.

5.9.2 The spring opening should be between 1/32" [0.8mm] and 1/16" [1.6mm] maximum (see figure 5.37). This is all that is required to make most units on a SUPERPAC.

5.9.3 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.9.4 If adjustment is needed, adjust the right hand stripper head adjusting link (clockwise for more, counterclockwise for less); keep an accurate count of how many flats you turn the right hand link (see figure 5.38).

5.9.5 Turn power back on. Hit MCR reset button.

5.9.6 In order to keep stripper head frame level, turn the left hand stripper head link in the same direction. Also turn it the same number of flats as was used to turn the right hand link.

**Note:** Spring opening may differ on each side.

5.9.7 Jog the machine to the stripped-through position. At this point, the stripper shoes should protrude through the mold by 1/8" [3mm] to 1/4" [6mm].
5.9.8 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.9.9 If adjustment is needed, adjust the shock absorbers. Record the adjustment made for future calibration.

5.9.10 Start machine and run machine to second stop, when height pins first meet.

5.9.11 Shut off clutch and turn power off. Wait until motor has stopped completely. Also, lock out machine.

5.9.12 The machine is ready to run; final adjustment may be needed when production is started. The shock absorbers should be adjusted so they take equal load on each side (see figure 5.39).

**WARNING:** All safety guards must be in place when the SUPERPAC is running.

---

Figure 5.39 SHOCK ABSORBERS.
SECTION 6
TIMING THE PALLET FEEDER.

It is important that the pallet feeder be well synchronized with the rest of the machine. This adjustment must be done before the machine is run for the first time and each time a mold change is done.

6.1 INITIAL CONDITIONS

6.1.1 No mold or head in machine.

6.1.2 Inner frame adjusted for height (see section 4).

6.1.3 Pallet receiver stroke set for mold (see section 4).

6.1.4 Machine has no excessive wear or damage.

6.1.5 Front delivery conveyor 31.25" [794mm] above top of machine base (see section 4).

6.1.6 Make sure the pallet feeder drive chain and lug chains (see figure 6.1 and 6.2) are well adjusted. To adjust those chains, follow the procedure presented on the next two pages.

Figure 6.1  PALLET FEEDER DRIVE CHAIN.

Figure 6.2  PALLET FEEDER LUG CHAINS.
A. PALLET FEEDER DRIVE CHAIN ADJUSTMENT

With the machine off, check pallet feeder drive chain tension on right hand side of machine. Tension chain until it cannot be moved back and forth by hand more than 1/4" [6MM]; recheck periodically (see figure 6.3).

To adjust the pallet feeder drive chain tension, follow this procedure:

A. Loosen the fixing bolts (A).
B. Move the tensioner (B) up or down as required.
C. Tighten the fixing bolts (A).

Figure 6.3 PALLET FEEDER DRIVE CHAIN ADJUSTMENT.
B. PALLET FEEDER LUG CHAINS ADJUSTMENT

With machine off, check tension of pallet feeder lug chains. Adjust tension at rear end of pallet feeder. Bottom strand of each chain sags down in center by approximately 1/2" to 3/4" [13mm to 19mm]; recheck periodically.

To adjust the pallet feeder drive chain tension, follow this procedure (see figure 6.4 and 6.5):

A. Loosen the clamp bolts (A) on the inside and on the outside of the machine.
B. Adjust the tension with the tensioning screw (B).
C. Tighten the clamp bolts (A).
6.2 TIMING THE PALLET FEEDER

6.2.1 Run machine to align punch marks on pallet raising cam (innermost cam on left side of machine) with center of roller that contacts it (see figure 6.6).

Figure 6.6  PALLET RAISING CAM.
6.2.2 With power off, rotate block delivery drive sheave by hand (picture 6.7) counterclockwise, until block delivery bars are full forward (see figure 6.8), both link pins and gear box shaft are in line.

Figure 6.7  POSITIONING BLOCK MOVING BARS BY HAND.

Figure 6.8  EXTREME FORWARD POSITION OF BLOCK MOVING BARS.

CAUTION: Figure below is shown with guard removed and is for illustration purposes only. Never operate machine without the guards. Machine should be locked and tagged!
6.2.3 Adjust pallet cradles to be centered with pallet receiver rubbers (see figure 6.9).

6.2.4 Set actuator on block delivery drive cam to trip LS-7 (see figure 6.10).

Figure 6.9 ADJUSTING THE PALLET CRADLE.

Figure 6.10 LIMIT SWITCH LS-7.
6.2.5 Rotate block delivery drive counterclockwise (see figure 6.7) until arms are fully back (see figure 6.11). In this position, the pins in the link will be aligned with the gearbox shaft.

6.2.6 Adjust block fingers to center them with the pallet receiver rubbers (see figure 6.12).

Figure 6.11 EXTREME BACK POSITION OF BLOCK MOVING BARS.

Figure 6.12 ADJUSTING THE BLOCK MOVING BAR FINGERS.
6.2.7 Locate top of pallet spring stops even with top of pallet resting on the chains (see figure 6.13).

**Note:** Pallet cradle is at same height as lug chain.

6.2.8 Move spring stop assembly so springs are 1/4" [6.5mm] to 1/2" [13mm] in front of a pallet centered in pallet cradles. Also, top of spring should be flush with top of pallet. (see figure 6.14 and 6.15).
6.2.9 Adjust pallet chain lugs to be even with back of pallet (see figure 6.16) by removing shear bolt and moving shaft (6.17). Use wrench to adjust lug chain (6.18). Place shear bolt assembly in holes that align and tighten.  

6.2.10 Adjust the actuator for LS-6 to trip the switch by 2” (see figure 6.19).

**CAUTION:** Figure below is shown with guard removed and is for illustration purposes only. Never operate machine without the guards! Machine should be locked and tagged.

Figure 6.16 LUG (A) SHOULD BE CONTACTING PALLET WHEN IN CRADLE (B).

Figure 6.17 REMOVING THE SHEAR BOLT.
CAUTION: Figures below are shown with guard removed and are for illustration purposes only. **Never** operate machine without the guards. Machine should be locked and tagged.

![Figure 6.18 USING PIPE WRENCH TO ADJUST LUG CHAIN.](image)

**Figure 6.18** USING PIPE WRENCH TO ADJUST LUG CHAIN.

![Figure 6.19 LIMIT SWITCH ACTUATOR.](image)

**Figure 6.19** LIMIT SWITCH ACTUATOR.
6.2.11 Run machine until pallet receiver frame is all the way down; roller is in lowest part of pallet receiver cam.

6.2.12 Place pallet on fingers and adjust block raising link on left side of machine (see figure 6.20), to obtain 35 1/2" [902mm] from top of base plate to bottom of pallet. Make sure there is 1/4" [6mm] of clearance between bottom of pallet and pallet receiver rubbers (see figure 6.21).
6.2.13 Rotate block delivery drive CCW until punch marks on high part of cam align with the center of the roller (A) (see figure 6.22).

6.2.14 Loosen the clamp bolt (B) and adjust the jack screw (C) on the right hand side of machine, until a piece of paper can just be slid between the cam and roller. Tighten clamp bolt (B).

6.2.15 Run machine and, at the moment where the pallet is beginning to be lifted off the chain, make sure the pallet is centered on the cradle. If pallet is not in center of cradle, turn off machine and readjust chains, refer to 6.2.8. When delivery arms come all the way back (see figure 6.11), drive link to cam must be in line with gear box shaft; if not adjust actuator for LS-6 (see figure 6.19).

Figure 6.22 BLOCK LOWERING ARM ADJUSTMENT.
6.2.16 Adjust speed of block delivery by moving motor towards gear reducer to increase speed or away to decrease speed (see figure 6.23). The actuators for limit switches 6 and 7 may have to be adjusted.

Figure 6.23 USING CRANK TO ADJUST BLOCK MOVING ARM SPEED.

CAUTION: Figure below is shown with guard removed and is for illustration purposes only. Never operate machine without the guards. Machine should be locked and tagged.
The rotary sensor setting should be done each time the rotary sensor has been removed or disconnected. It should also be done after a “rotary sensor is out of sync.” fault has appear on the screen.

7.1 As an initial condition, cycle the machine to the “first stop” position. “First stop” is obtained when the punch marks on the cam are in line with the roller. (see figure 7.2). In this position, the feedbox should be all the way forward and the roller should be centered on the first stop mark of the pallet receiver cam. At this point, the “Rotary sensor value” should be indicating 100° on the rotary sensor adjustment screen (see figure 7.1, for more details see section 10.4). To reach this screen, press “F2” from the main menu.

7.2 If the rotary sensor value shown in the screen is not 100°, loosen rotary sensor coupler (A) (as shown in figure 7.3) and make adjustment. To adjust, turn rotary sensor coupler until 100° is reached. Use the screen to monitor the rotary sensor. Make sure you tighten rotary sensor coupler before resuming adjustment.

7.3 Run the machine to “second stop” position which is controlled by the rotary sensor. The roller should be centered with the “second stop” marks on the pallet receiver cam. “Second stop” is the point where the stripper head shaft roller just falls off the high lobe of the stripper head raising cam. The stripper head raising cam is the second cam from the outside on the right side of the machine (see figure 7.4).

Note: As the machine ran from first stop to second stop, the value must count in a positive direction (meaning from 100° to 180° in 1° increments). If the value is not incrementing in a positive direction, rotate the screw on the back of the rotary sensor to opposite position.
Figure 7.2  "FIRST STOP" (R.H. side of machine).

Figure 7.3  ROTARY SENSOR COUPLER ADJUSTMENT.

Figure 7.4  STRIPPER HEAD RAISING CAM.
8.1 OPERATING THE SUPERPAC

This section will guide you, the operator, through the actual operation of the SUPERPAC. First, read the sequence of the machine in order to have a good understanding of how the machine works and how you can make adjustments to produce perfect concrete blocks or pavers. Of course, the machine has to be setup before it can be operated properly. Adjustments on the pallet feeder, on machine timing and on adjustments for specific molds have to be made prior to the sequence outlined in this section.

8.2 HOW A CONCRETE PRODUCT MACHINE WORKS

The SUPERPAC is a six-at-a-time block machine rated at up to 3,240 blocks per hour. A concrete unit is made when concrete is fed into a mold and is then vibrated and compacted. Once it has been compacted, it is stripped out of the mold and delivered onto a conveyor. Many types of molds can be fitted on the machine to obtain a wide variety of products.

Refer to section 3 “MACHINE DESCRIPTION” to learn about the names and locations of the machine’s components.

All of the machine’s movements are controlled by cams located on a main shaft. As the cams turn with the main shaft, they activate rollers which are connected to link rods which in turn are connected to the components. These components either go forward and back or up and down. One cam brings a component forward (or up) and another brings it back (or down). The main shaft is powered by a motor and a clutch. The motor runs all the time. It is the clutch that will stop and start all machine movements. The only operation not activated by the main cam is the block delivery arm which feeds empty pallets to the mold and pallet with blocks to the exit conveyor. This component is powered by a motor and is independent because it sometimes has to keep running while the rest of the machine is stopped.

The pallet has to be lifted at one point in the process; a cam does that. A stripper head frame is also connected to two different cams to move it up and down. A stripper head, which is part of the mold, has to be installed on the stripper head frame. This stripper head will press on top of the units to compact them. A pallet receiver frame is located below the stripper head. This component holds the pallet and the mold in place during the concrete unit forming process (stripper head is pressing and the mold is vibrating). The pallet receiver is connected by links to a cam on the main shaft to move up and move down through gravity. The last two cams will bring a feed box forward and back. This feed box pushes the material (concrete) to the mold. Concrete will fall into the feedbox through a hopper located on top of the machine. An agitator grid placed in the feedbox will agitate the material as it falls in the mold for better distribution of the concrete. The Agitator is powered by a motor located on the feedbox.

Finally, one motors on each side of the machine vibrate the mold. The vibration occurs when the concrete is fed in by the feedbox and when the units are being compressed by the stripper head. Vibration only lasts a few seconds but it is crucial to making concrete units.
8.3 MACHINE SEQUENCE OF OPERATION:

1. Machine cycle begins with feedbox ready to start forward when main drive clutch solenoid is energized.

2. With feedbox on its way forward, vibrators and agitators begin functioning.

3. Feedbox completes its forward stroke and stops over mold. At this point, the machine stops (at the position called “FIRST STOP”).

   While in “first stop”, the following occurs:
   - Feed timer is turned ON
   - Feed timer times out, which re-starts machine.

4. Feedbox returns to home position, at which time-
   - Agitator turns OFF
   (At this time, machine keeps cycling)

5. Stripper head drops onto concrete in mold. At this point, machine stops (this position is "SECOND STOP").

   While at “second stop”, the following occurs:
   - Height pin control circuit is turned ON
   - Finish timer starts and autofeed control circuit is enabled.
   - When height pins meet, finish indicator stops and delay timer begins. At this point, the autofeed mechanism or feed time is adjusted, and if necessary (actual finish time was not equal to desired finish time).
   - Delay timer times out which:
     - Starts the strip delay timer - Turns off vibrators
     - Strip delay timer times out which-
     - Turns ON main drive

6. Machine strips units from the mold. If a fault occurs, machine stops. If no fault occurs, pallet moving bars pick up empty incoming pallet from pallet feeder conveyor. Pallet with block is deposited on block moving support fingers while:

   - Stripper head is raising
   - Block moving bars travel to their most forward position.
   - If limit switch LS-7 is tripped before rotary sensor reaches “third stop” position (approximately 25°), NO “THIRD STOP”.
   - If rotary sensor reaches “third stop” position before Ls-7 is tripped, main drive stops until LS-7 is tripped, this is the “THIRD STOP” position.

7. Block moving bars lower and return to extreme rear position.

   - LS-6 tripped which-stops Block moving bars.

Machine cycle is complete; a new one begins.
8.4 MACHINE SEQUENCE AND THE ROTARY SENSOR

The figure below represents the machine sequences in accordance with the rotary sensor values (in degrees). It will help you understand better how the machine cycle works and how to adjust parameters such as feed time, finish time, delay time and strip delay time which are crucial in making good quality concrete products.

Figure 8.1   MACHINE SEQUENCE CYCLE.
8.5 INITIAL STARTING POSITION

Make sure all the following are set properly.

1. Make sure “EMERGENCY STOP” button is pulled out.
2. Make sure “CLUTCH” switch is “OFF”.
3. Make sure “VIBRATOR” switch is “OFF”.
4. Press and release “MCR RESET” push button. Machine will start.
5. Press and release “VIBRATOR START” push button. The vibrators will start.
6. Press F1 from the run screen and verify all selections are correct:
   - Height pins are [ENABLED].
   - Agitator is [ON].
   - Air compaction is [ON].
   - Slump mode is [OFF].
   - Pallet cleaner is [OFF].
   - Auto feed time adjust is [OFF].
   - Auto feed is in [AUTO].
   - Auto height pin by pass is [DISABLE].
   - Dual vibration is [OFF].
7. Set the “VIBRATOR” switch to “AUTO”.
8. Set “CLUTCH” switch to “ON”.

Note: Enabling these items may not be required for all products.

The machine will sound an alarm for 7 seconds and begin cycling.

To stop the machine, set the clutch switch to “OFF” or push in the “EMERGENCY STOP” button.

8.6 PROCEDURES TO RUN MACHINE FOR FIRST TIME OR WHEN NEW MOLD HAS BEEN INSTALLED

Make sure pre-run procedures have been done and initial start-up position is obtained before going through these adjustments.

First, the operator has to decide of the quality of concrete units he wants to produce.

The quality depends on two (2) factors:
   - the mix.
   - the machine adjustments.

The machine adjustments for making units are done by adjusting the forming time and the autofeed adjustment. The forming time includes the feed time, the finish time and the delay time. The following is a description of these parameters on the machine which will help you understand how to adjust the machine.

Note: These explanations are better covered in section 9: Hand & Machine Interface.

FEED TIME:
Amount of time the feed box is stopped over the mold. This will control the amount of material (concrete) placed in the mold.

FINISH TIME:
Preset time that you will expect desired finish time, from the moment stripper head shoes hit material to when height pins meet each other. Machine will adjust the finish time by adjusting the autofeed mechanism or the feed time (the operator has to select which one he prefers the machine to change. See section 9.3: “Hand & Machine Set-up”.

DELAY TIME:
The time of vibration after height pins meet.

STRIP DELAY TIME:
Time from the moment vibration stops to when units are stripped out of the mold. Note that the strip delay does not influence the quality of the units. The strip delay will simply slow down the process.

1. Adjust parameter for feed time to approximately 1 1/2 seconds.
2. Adjust parameter for finish time to approximately 1 1/2 seconds.
3. Adjust parameter for delay time to approximately 1 1/2 seconds.

4. Set “Autofeed” to “MAN” position.

5. Adjust it to 1/2” [13mm].

6. Start making units (start machine) (see section 8.5).

7. Check units coming out. Check for cracks, dimensions and density.

8. If units are not perfect, modify finish time until units are perfect. To modify finish time, refer to section 9.5: “Timer adjustment”.

9. If units continue being cracked, check delay time; it is probably not sufficient. Too much material introduced in the mold can also cause the cracks.

10. If the units are still not perfect, see section 10: “Troubleshooting” for more details.

Note: We strongly suggest you use the “Autofeed Mechanism” for most units. It will allow you to produce consistent products. The use of “Autofeed Mechanism” is not recommended for low height units.
9.0 GRAPHIC CONTROL STATION

Note: In this section, the term "SLC" will be used in reference to the "Small Logic Controller".

Use these keys to select a menu.

These keys are not in use.

These keys are used to enter a name or parameters.

These keys are used to move cursor up and down and left to right.

This key allows the operator to erase a parameter.

This key is used to accept a parameter after it has been typed in.
Emergency stop, complete shut off of machine. Needs to be pulled out to start the machine.

Master control delay reset. Enables the machine to function (emergency button has to be pull out first). This will override the height pins (simulate the meeting of height pins).
HAND mode: vibration will start whenever switch is set to this position.
AUTO mode: vibration will occur during the appropriate time during the operation of machine.

Start vibrating motors but not the vibration itself.
To start actual vibration, use the "hand-off-auto" button.

Starts the main drive, but not the machine operation (clutch).

Jogs the machine only when the clutch selector switch is set to "Jog".

To start automatic operation.
At "Off", it stops the auto operation.
At "Jog", the machine can be jogged with the "Main drive jog" button.

OPTIONAL

Used to remove or install the mold with the stripper head.
Lock and unlock.
Raise and lower.
Red box will appear when height pins have made contact.

**Note:** Use blue light indicators on both sides of display screen to monitor height pins. They are more accurate than the ones on the display screen.

Number of cycles run by the machine since the last product change or since last reset.

**Note:** Machine will ignore cycle counts when vibrators are turned off (dry cycles are not counted).

Life time cycle counts (cannot be reset).
8 alpha-numeric digits are used to name a particular product (ex.: B001 for block 1). Use keys 0 to 9 and A to F.

**FEED TIME**
Amount of time the feed box is stopped over the mold. This will control the amount of material (concrete) placed in the mold.

**FINISH TIME**
Preset time that you will expect desired finish time, from the moment stripper head shoes hit material to when height pins meet each other. Machine will adjust the finish time by adjusting the autofeed mechanism or the feed time (the operator to select which one he prefers the machine to change with (uses F1, F7 or F8)).

**DELAY TIME**
The time of vibration after height pins meet (F3 timer 2)

**STRIP DELAY TIME**
Time from the moment vibration stops to when units are stripped out of the mold.(F3 timer 3)

Use F11 & F12 KEYS to modify feed time by 0.1 second increments.
9.2 FAULT MESSAGE ON BLOCK MACHINE RUN SCREEN

This screen will be displayed every time a fault occurs.

When this message appears, follow this procedure:

1. Press F7 to inquire about the fault.
2. Correct the fault (see Trouble Shooting section).
3. Turn the clutch selector switch to "OFF".
4. Press the F9 key.
5. Turn clutch switch "ON"

The machine will sound an alarm and restart.
9.3 HAND & MACHINE SET UP  F1

This screen allows the operator to turn some of the machine's components ON and OFF.

To access this screen from the RUN SCREEN, press F1.

**F2:** Normally enabled. The machine will not continue beyond point where height pins meet. It can be useful for single cycle runs.

**F3:** Turns the agitator ON or OFF.

**F4:** Turns the air compaction cylinders ON or OFF.

**F5:** If enabled, machine only needs 1 height pin to meet in order to continue cycle.

**F6:** Turns the pallet cleaner ON or OFF.

*Note:* The pallet cleaner is optional.

**F7:** If enabled, the feed time will be automatically adjusted, otherwise, no adjustment will be made by the machine. The automatic feed time adjustment will be made with 0.1 sec increments. If you wish to change this increment, change value of register of N7:35 (see section 10.9, data table display "F7"). Here, the normal value is equivalent to 0.1 seconds.

**F8:** Turns the autofeed system ON or OFF

ref. timer  8 = manual adjustment increment (time of travel)
ref. timer 10 = automatic adjustment increment (time of travel)

**F9:** If enabled, a timer will control the finish time (refer to timer 23)

**F10:** Turns horizontal core ON and OFF (optional)

**F11:** Main drive speed selection (single or dual speed)

**F12:** *Only on Dynapac* Selects speed of block moving bars

**F13:** *Only on Dynapac* Selects speed of block moving bars
9.4 ROTARY SENSOR ADJUSTMENT F2

This screen allows the user to change the preset values of the rotary sensor. The rotary sensor is located at the end of the main shaft. Its purpose is to synchronize the machine and all its components. This screen also allows the user to acknowledge the present rotary sensor value. To access this screen from the RUN SCREEN, press F2.

First stop:
Should occur when indicating 100°.

Second stop:
Should occur when indicating 180°.

Third stop:
Should occur when indicating 25°.

1st, 2nd & 3rd stop offset:
Window for stop position. (accuracy)
Ex.: If offset is 10°, 1st stop can be between 90° and 100°
This value (10) will be subtracted from the stop value (100) to give range of operation to the rotary sensor to determine a stop.

Agitator start:
The location on the rotary sensor where the agitator is turned ON.

Agitator stop:
The location on the rotary sensor where the agitator is turned OFF.

Vibration start:
The location on the rotary sensor where the vibrators start (no stop location) (stop is controlled by a delay time).

Air compaction start:
The location on the rotary sensor where the air compaction starts (no stop location) (stop when height pins meet).

BM, VIB, AGIT & Air comp offset:
Window for these components. (accuracy)
Ex.: If offset is 10°, BM bars can be between 250° and 260°
This value (10) will be subtracted from the value (250) to give range of operation to the rotary sensor to determine a stop.

Start block moving bars:
The location on the rotary sensor where the block moving bars start.

Start of main drive 2nd speed & End of main drive 2nd speed:
Used with main drive frequency control.
Establishes when you start and stop 2nd speed.

F6 Press this key to change any of the preset values. Use arrows to select. Use numbers to change values. Use to make changes.

PRESENT ROTARY SENSOR VALUE : 50
It will indicate the rotary sensor location at present time.
9.4.1 TO CHANGE PRESETS
To change any of the rotary sensor value, follow these steps:

1. From the RUN SCREEN, press the F2 key.

The display will read:

2. Use the arrows to move the cursor to the item you wish to modify the Rotary Sensor value.

3. Press the F6 key.

The display will read:

4. Enter new Rotary Sensor value, from 0 to 359 (0 to 359 degrees).

5. Press the key.
9.5 TIMER ADJUSTMENT F3
These two screens allow the operator to visualize and to change preset timer values. There are 24 timers (0 to 23) which are accessible through these screens. Additional timers are accessible through the DATA TABLE DISPLAY (F7 then F4). See appendix "A" for all timer addresses and descriptions. Each timer has a specific function related to the machine's overall performance. The timers and their functions are listed on the next page. Timers 0 to 3 are the most used timers; they control functions which are directly related to production. To access this screen from the RUN SCREEN, press F3.

Press F1 to go to previous page or to return to the RUN SCREEN.

Use arrows on the keyboard to select a timer.

Press F4 to change preset value.

Press F8 to go to the next page (timers 12 to 23).
9.5.1 TO CHANGE PRESETS
To change any of the Timer value, follow these steps:

1. From the RUN SCREEN, press the F3 key.

   The display will read:

   ![Timer Access Screen]

2. Use the arrows to move the cursor to the timer of which you wish to modify the value.

3. Press the F4 key.

   The display will read:

   ![Timer Access Screen]

4. Enter new Timer value, from 0 to 32767.

5. Press the key.
### TIMER FUNCTION

</tr>
</tbody>
</table>
9.6 INPUT / OUTPUT STATUS

These screens represent the status of all electrical components on the block machine. They can be used to isolate one component on the machine or to locate an electrical fault on one of the components.

To access this screen from the RUN SCREEN, press F7 to go to the Diagnostics screens, then press F3.
Press F8 to go to the next page.
9.7 MACHINE SETUP
Machine Setup enables the user to enter some of the basic data into the machine such as the type of machine and
control station. It is also possible to enable and disable some of the machine’s components. This is done when a
new start-up is done or when a lost program or SLC-500 malfunction occurs.
To access this screen from the RUN SCREEN, press F16.
9.8 PRODUCT TABLE  F5

This menu allows you to store and retrieve preset recipes which include Feed time, Finish time, Delay time, and Strip delay time and other parameters. There is a possibility of 100 product numbers. To access this menu from the RUN SCREEN, press F5. To return to the RUN SCREEN, press F1

With this menu, you may:
- Enter into the SLC memory a name for different products.
- Enter preset recipes for each of those products.
- Modify any preset recipe for any product.

The screen below shows an example of a product number. As an example, we gave the name TEST. From here, the user may select a product number, edit recipe data, save recipe settings, change product name and load product to run.

F1  Return to RUN SCREEN.

F2  SELECT PRODUCT NUMBER: Used to select an existing product number.

F3  EDIT DATA SCREEN: Used to enter data such as product height, unit types etc.

F4  SAVE SETTINGS TO RECIPE: Used to save recipe settings, once you have entered data for recipe.

F5  CHANGE PRODUCT NAME. Since each product has a name, it is possible to change a product name with this function.

F6  LOAD PRODUCT TO RUN: .Machine won't use the recipe parameters until you load product to run.
9.8.1 TO SELECT A PRODUCT NUMBER:

1. From the SELECT PRODUCT SCREEN, press the F2 key.

The display will read:

2. Enter product number you wish to change, edit or load. (from 0 to 100)

3. Press

The screen will now show the selected product number.
9.8.2 TO EDIT RECIPE DATA:

1. From the SELECT PRODUCT SCREEN, press the F3 key.

   The display will read:

   ![EDIT DATA SCREEN]

   - Press the F6 key to change preset. Value can be from 0 to 65535.
   - Press \( \text{enter preset into memory} \) to enter preset into memory.

2. Use arrows to move cursor to any of the preset you wish to modify.

3. Press the F6 key to change preset. Value can be from 0 to 65535.

4. Press \( \text{enter preset into memory} \) to enter preset into memory.

From this screen, you may also access the timers by pressing F3 and the Smartpac settings by pressing F8.

Once you are finished entering data for presets, press F1 key to return to previous screen.
9.8.3 TO SAVE SETTINGS TO RECIPE:

1. From the SELECT PRODUCT SCREEN, press the **F4** key.

The display will read:
9.8.4 TO ENTER OR CHANGE PRODUCT NAME:

This function is used to load the product number currently selected.

1. From the SELECT PRODUCT SCREEN, press the F3 key.

The display will read:

2. Use arrows to move cursor to any number from 0 to 9 or any letter from A to Z. A “space” and “end text” is also available.

3. Press the F9 key.

4. Use arrows to move cursor to any other character listed above.

5. Press the F10 key.

6. Repeat same steps using F10, F11, F12, F13, F14, F15 and F16 until 8 character name is complete.

7. Press the F6 key to save entered text.

**Note:**
- At any time, press F5 key to erase all character in box.
- You may also use F7 and F8 keys to scroll up and down.
9.8.5 TO LOAD PRODUCT TO RUN.

1. From the SELECT PRODUCT SCREEN, press the **F6** key.

   The display will read:

   ![Select Product Screen]

   - Enter product number you wish to change, edit or load. (from 0 to 100)

2. Enter product number you wish to change, edit or load. (from 0 to 100)

3. Press

   The screen will now show the selected product number.
9.9 CYCLE TIMER

This menu allows the operator to monitor each machine cycle through a graph. It will indicate the time it took to do each cycle and also it will show the average time for the last 10 cycles.

To access this screen from the RUN SCREEN, press F7. Then press the F4 key.

The display will read:

---

Average cycles per minute

Average time it takes the machine to complete one average cycle (based on the last 10 cycles)

Time it takes the machine to complete one full cycle. Example here: 8.55 seconds

Total amount of time the machine has been running. Can be reseted by using the F8 key.
9.10 DIAGNOSTICS  F7

This menu allows the operator to monitor the machine once a fault condition has occurred.

To access this screen from the RUN SCREEN, press F7. To return to the RUN SCREEN, press F1

The display will read:

This screen will show a diagram of the machine and indicate where the fault is located.

From this screen, you can access the Data table. The Data table enables the operator to monitor or change parameters concerning: Control relays, Timer and Counter presets as well as Integer value.

To access the Data table, press the F2 key.

The display will read:

From this screen, the operator has access to 6 different menus. See next pages for description of these menus.
To change or monitor any of the parameters, press any of the keys between F2 and F7.

9.10.1 TO MONITOR A SLC500 STATUS (F2):

From the RUN SCREEN, press F7.

1. Press the F2 key.

The display will read:

2. Press the F2 key.

3. Enter a status word here then press ENTER. A word is an address to a memory location for a timer, a counter, an integer value or a control relay. Refer to appendix A for address location.

To change a preset value:

4. Press the F16 key.

5. Enter new value.

6. Press ENTER.
9.10.2 TO MONITOR A CONTROL RELAY (F3):

From the RUN SCREEN, press F7.

1. Press the F2 key.

The display will read:

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
F1 PREV MENU F2 SLC500 STATUS (S) F3 CONTROL RELAY (R) F4 TIMER PRESET (T-PRE) F5 COUNTER PRESET (C-PRE) F6 COUNTER ACCUM (C-ACC) F7 INTEGER VALUE (N) F8
```

2. Press the F3 key.

3. Enter a control relay bit address here then press ENTER. Refer to the logic diagram in appendix A for proper address location.

**To change a preset value:**

4. Press the F16 key.

5. Enter new value.

6. Press ENTER.

The SLC shows here bit value for this address.

0 = OFF
1 = ON
9.10.3 TO MONITOR OR CHANGE A TIMER PRESET (F4):

From the **RUN SCREEN**, press **F7**.

1. Press the **F2** key.

   The display will read:

   ![Data Table Display]

   2. Press the **F4** key.

   3. Enter a *Timer* address here then press ENTER. (Example here is 0) Refer to appendix A for proper address location and description.

To change a preset value:

4. Press the **F16** key.

5. Enter new value.

6. Press ENTER.

The SLC shows here the preset value for this timer. NOTE: A time base should be taken into account when establishing true time value.
9.10.4 TO MONITOR OR CHANGE A COUNTER PRESET (F5):

From the **RUN SCREEN**, press **F7**.

1. Press the **F2** key.

The display will read:

2. Press the **F5** key.

3. Enter a **Counter** address here then press ENTER.
   (example here is 5) Refer to appendix A for proper address location and description.

**To change a preset value:**

4. Press the **F16** key.

5. Enter new value.

6. Press ENTER.
9.10.5 TO CHANGE THE ACCUMULATED VALUE OF A COUNTER (F6):

From the DATA TABLE DISPLAY SCREEN,

1. Press the **F2** key.

The display will read:

2. Press the **F16** key.

3. Enter new value.

4. Press ENTER.

To change the accumulated value of a counter:  

The SLC shows the inner value for this counter.
9.10.6 TO MONITOR OR CHANGE A INTEGER WORD VALUE (F7):

From the **RUN SCREEN**, press **F7**.

1. Press the **F2** key.

The display will read:

2. Press the **F7** key.

3. Press the **F7** key.

4. Enter a *Integer file* number here then press ENTER.(example here is 7)

5. Press the **F8** key.

6. Enter a *word* number then press ENTER (example here is 70)

7. Press F16 to change word value.

Refer to the logic diagram in appendix A for proper address location and description.
9.11 PRODUCT QUANTITY CONTROL  F6
This menu allows the operator to enter a desired preset production count and to set the count warning. To access this screen from the RUN SCREEN, press F6.

9.11.1 TO HAVE THE PRODUCTION COUNT WARNING SHOW:
Press the F2 key to toggle between Disabling and Enabling the production count warning.

9.11.2 TO RESET THE PRODUCTION COUNT:
Press the F3 key and the production count will be reset.

9.11.3 TO SET A NEW PRODUCTION COUNT WARNING:
1. Press the F4 key to set new preset in the thousands.
2. Enter a new present production preset (1=1000  /  999 = 999,000)
3. Press ENTER.
4. Press the F5 key to set new preset in the hundreds.
5. Enter a new present production preset (1=1  /  999 = 999)
6. Press ENTER.

When the machine cycle count will have reached this preset value, a warning will show on the screen if you have enabled this warning.

This warning is shown on the next page.

Once this warning has occurred, press any key to return to the RUN SCREEN.

Note: This will automatically reset the production count to 0.
PRODUCT QUANTITY REACHED
PRESS ANY KEY
9.12 SMARTPAC ADJUSTMENT  F4
This menu allows the operator to enter desired vibrator speed and amplitude for the SMARTPAC vibrating system. The operator can also access some other data such as speed and amplitude range.
To access this screen from the RUN SCREEN, press F4. (SMARTPAC VIBRATION)

9.12.1 TO CHANGE VIBRATION PRESET VALUES:
1. Press the F3 key to select a vibration mode. The screen above shows an example where the operator has selected the Single vibration mode. To change the Smartpac preset value, press the F6 key.

   The display will read:

2. Enter the new preset value (from 0 to 3200)

3. Press the key.

   Single vibration

   Double vibration

   In this case, the Single vibration mode has been selected.

   Speed and amplitude ranges:
   If values is not within these values, the message “value out of range” will appear on screen.
SECTION 10
TROUBLESHOOTING

THIS SECTION WILL HELP YOU SOLVE TWO KINDS OF PROBLEMS:

1. Problems with machine. Those problems are diagnosed by the Small Logic Controller (see section 9) and will show up on the screen as outlined in section 10.1 below.

2. Problems with the concrete units. Those problems are diagnosed by looking at the concrete units as outlined in section 10.2.

10.1 SMALL LOGIC CONTROLLER FAULTS.

10.1.1 WHEN A MECHANICAL FAULT OCCURS, THE MACHINE STOPS AND THE FAULT SHOWS ON THE SCREEN. WHEN THIS HAPPENS:

1. The display on your Graphic Control Unit will read:

```
BLOCK MACHINE RUN SCREEN

FINISH TIME INDICATOR
9.18

LEFT HEIGHT PIN
RIGHT HEIGHT PIN

PRODUCTION QUANTITY MET
GOTO F5 PRODUCT QUANT CONTROL
SCREEN TO RESET COUNTERS

TOTAL PRODUCT CYCLES - CODE: 000
(TOTAL PRODUCT CYCLES - CODE: 000)

FINISH TIME 9.18
TOTAL MACH.

MACHINE FAULT
PRESS DIAGNOSTICS BUTTON FOR INFO

MAIN MOVE IS ON

PRODUCT NUMBER - DESCRIPTION
A 1
FIELD TIME 0.10
FINISH TIME 0.10
DELAY TIME 0.10
STEP RELAY TIME 0.15

PRESS F7 OR F5 TO CHANGE FEED TIME

P1: HAND & MACHINE SETUP
P2: ROTARY SENSOR ADJUST
P3: TIMER ADJUST
P4: SMART- PAC ADJUST
P5: SELECT PRODUCT
P6: PRODUCT QUANTITY CONTROL
P7: DIAGNOSTICS SCREE
P8: STOP & HOPPER

Screen indicates that there is a fault in the machine.
```

2. Press F7 to inquire about the fault (diagnostic).

The display will read:

```
CONTROL PANEL

BESSER

BLOCK MACHINE

TURN THE CLUTCH SELECTOR SWITCH OFF BEFORE ATTEMPTING A SAFETY RESTART

P3: RUN SCREEN
P2: DATA TABLE
P1: STATUS DIAGNOSIS
P0: CYCLE TIMER
P9: SAFETY RESTART

This screen shows a diagram of the machine and indicates where the fault is located.
```
3. Correct the fault.

Once the fault has been corrected:

4. Turn the clutch selector switch to "OFF".

5. Press the F9 key.

6. Turn clutch switch "ON".

The machine will sound an alarm and restart.

**10.1.2 LIST OF CONCRETE PRODUCTS MACHINE FAULTS**

**1. THE VIBRATOR, AGITATOR, AUTOFEED OR PALLET CLEANER MCP OR OVERLOAD IS TRIPPED.**

The vibrator, agitator, autofeed or pallet cleaner motor circuit protector (MCP) or overload is tripped. This error may indicate:

- Motor is not rotating freely. Verify motor rotation.
- Motor has an electrical short in its winding. Check resistance of winding.
- Wiring to the motor is shorted. Verify continuity of wiring to motor.

**2. THE MAIN DRIVE MCP OR OVERLOAD IS TRIPPED.**

The main drive motor circuit protector (MCP) or overload is tripped. This error may indicate:

- Motor is not rotating freely. Verify motor rotation.
- Motor has an electrical short in its winding. Check resistance of winding.
- Wiring to the motor is shorted. Verify continuity of wiring to motor.

**3. THE BLOCK MOVING BAR DRIVE MCP OR OVERLOAD IS TRIPPED.**

The block moving bar motor circuit protector (MCP) or overload is tripped. This error may indicate:

- Motor is not rotating freely. Verify motor rotation.
- Motor has an electrical short in its winding. Check resistance of winding.
- Wiring to the motor is shorted. Verify continuity of wiring to motor.

**4. THE SYSTEMS AIR PRESSURE IS LOW.**

The system air pressure switch PS-13 indicates low pressure.

- Insure the air compressor is working properly.
- Check for proper connection of air lines.

**5. THE LUBE RESERVOIR IS LOW.**

The lube level switch LS-11 indicate that the grease reservoir is low.

- Refill grease reservoir as required (see section 11).
6. MACHINE ROTATION IS UNDER SPEED.

This condition can be caused by a motor or clutch deficiency. An object jammed in the machine can also cause this fault. If pallet jams the machine, the shear bolt on the timing sprocket will break to avoid further damage to the machine.

7. ROTARY SENSOR IS OUT OF SYNC.

The rotary sensor coupling has slipped. Adjust the rotary sensor to 100 degrees at 1st stop and tighten coupling clamps.

8. THE MATERIAL HOPPER IS LOW.

The material hopper is low of material and will not allow the machine to operate until additional concrete is delivered to the hopper. This condition may be bypassed by use of the "F8" key on the Run screen.

9. THE MAIN DRIVE BESCODYNE IS OVER NORMAL TEMPERATURE.

The temperature sensor on the main drive bescodyne has tripped.
- Check oil level of bescodyne drive to insure it is properly filled.
- Replace oil as required (see section 11).

10. A VIBRATOR BESCODYNE IS OVER NORMAL TEMPERATURE.

The temperature sensor on the main drive bescodyne has tripped.
- Check oil level of bescodyne drive to insure it is properly filled.
- Replace oil as required (see section 11).

11. THE HEAD IS NOT PROPERLY CLAMPED (only on machine with Mold Head Clamp Device).

The mold head clamp device is not in the "UP" and "LOCKED" position.
- Insure sensor head "UP" sensor (PRS-16) is tripped. If it has not, raise head with use of the graphic display station.
- Insure sensor head "LOCK" sensors (PRS-12 and PRS-13) are tripped. If not, lock the head with use of the graphic display station.

12. THE PALLET MAGAZINE IS LOW.

The pallet magazine is low. The concrete units machine will not operate until pallets are provided to the magazine.

13. A PALLET SKIP ERROR HAS OCCURRED.

A pallet was not present on the Pallet Skip switch PRS-3 when the height pins met.
- Check to insure pallets are moving freely through machine.
14. A PALLET HAS BEEN ON LS-2A TOO LONG.

   A pallet is stopped over LS-2A on the front delivery conveyor too long.

   - Check to insure the front delivery conveyor is running, if not restart conveyor.
   - Check to insure pallets are moving freely on the front delivery conveyor.

15. THE MACHINE IS AT THIRD STOP TOO LONG. MAY HAVE MISSED LS-7.

   The machine is waiting at third stop too long and waiting for the block moving bars to travel forward.

16. THE MACHINE HAS CYCLED TOO MANY TIMES WITHOUT A LUBE CYCLE.

   The lube cycle switch LS-11 has not toggled on or off within a preset amount of machine cycles (Counter C5:0).

   - Check for blocked grease lines.
   - Check to insure the lube pump is working properly.
   - Increase lube pump cycle rate by decreasing the preset of lube pump timer (T4:5).
10.2 SOLUTIONS TO CORRECT DEFORMED AND CRACKED BLOCKS.

10.2.1 CRACKED FACE SHELLS

- Check mold to stripper head alignment (section 5).
- Check to see if core assembly is bent or twisted due to over tightening.
- Check mix (moisture content). An inconsistent moisture content in your mix may result in inconsistent concrete product quality. The use of a computerized moisture control unit in your mixer is recommended to improved product quality and consistency.
- Check pallet receiver guides on slide shaft (section 5).
- Increase delay time (section 9).
- Check shock absorbers.
- Check pallet receiver rubbers.
- Check admix.
- Check amount of material being left in mold after feedbox goes back.

10.2.2 HALF-MOON ON FACE SHELL

- Check for loose division plates.
- Check pallet receiver rubbers.
- Check that pallet is moving on the conveyor.
- Check vibrator bearings.
- Check pallet receiver rubbers (hardness).
- Check mold assembly.
- Check amount of admix in concrete.
10.2.3 LAMINATION ON FACE SHELL AND HORIZONTAL CRACKING

a. Check vibrator shaft speeds for R.P.M. (they should turn within 2 R.P.M. of each other - adjust with screw.

b. Check for metal to metal contact during vibration (mold vibrating against machine mold throat).

c. Check back apron plate alignment to mold (section 5)

d. Check that Feedbox is not vibrating on mold.

e. Check vibrator bearings.

f. Check delay time (decrease or increase). (section 9)

g. Check mix design.

h. Check for loose division plates.

i. Check for lack of proper admix.

j. Check slide shaft pucks (section 5).

10.2.4 FRONT OF BLOCK NOT FILLED

a. Check hopper gate setting.

b. Check feedbox travel forward.

c. Check agitator.

d. Check for chunks in feedbox.

e. Mix may be too wet.

f. Check feed time. Increase if necessary. (section 8 and 9).
10.2.5 AREA OF FACE SHELL TOO COARSE

a. Check machine hopper for build up.
b. Make sure vibrator sheaves are properly aligned.
c. Check vibrator weights for proper balance (equal length of clamping bolts and equal weight of nuts).
d. Check for loose mold parts.
e. Check for material segregation.
f. Check vibrator shaft speed.

10.2.6 SMOOTH TOP EDGE ON FACE SHELL

a. Check for division plate wear.
b. Make sure stripper shoes protrude through bottom of mold at completion of stripping.
c. Check stripper head alignment. (section 5)
d. Check for loose stripper shoes.
e. Check pallet receiver frame for level. (section 5)
f. Check moisture content of mix.
g. Check finish times. (sections 8 and 9)
h. Check feed time. Decrease if necessary. (sections 8 and 9)
i. Check autofeed mechanism. Lower if necessary.
10.2.7 BOTTOM EDGE CRUSHED

a. Check spring opening. (section 5)
b. Check delay time. (section 8 and 9)
c. Check stripper head alignment. (section 5)
d. Check pallet receiver rubbers.
e. Check for build up on bottom of mold.
f. Check for build up on pallets.
g. Check for spillage on pallet.
h. Check rubbers on cutoff bars.
i. Check the mix (can be too dry).
j. Check the air compaction setting (too much force).
k. Make sure pallet is against bottom of mold.

10.2.8 BLOCK CRUSHED DURING STRIPPING

a. Increase strip delay time. (section 9)
b. Check spring opening. (section 5)
c. Check moisture content of concrete.
d. Check for excess feed. Decrease feed time and lower autofeed if necessary.
e. Check vibrator brakes.
f. Check pallet delivery and timing.
g. Check air compaction setting.
10.2.9 CORE BAR CRACK

a. Check vibrator brake settings.
b. Check vibrators shaft speeds.
c. Check for loose cores.
d. Check vibrator sheave alignment.
e. Check pallet guides. Rear guides may have a groove worn so pallets stick during stripping operation (this may not apply to V4).
f. Check feed and finish time (it may need more).
g. Check for material build-up on core bars or core assemblies.
h. Check mix (it can be too dry).

10.2.10 CRACKING AT PALLET SIDE

a. Check for loose core assembly.
b. Check for bent core assembly.
c. Check pallet receiver frame for level.
d. Check pallet receiver rubbers. Pallet may be moving during finish time (it may require pallet snubbers).
e. Check pallet guides.
f. Check core bars for material build-up.
g. Check for thick and thin pallets.
h. Check vibrator brakes (may be slipping).
i. Check for material between pallet and pallet receiver rubbers.
j. Pallet receiver and stripper head alignments.
10.2.11 BLOCK HEIGHT NOT CORRECT FRONT TO REAR

a. Check pallet receiver frame for level (see section 5.4)

b. Check stripper head frame in relation to pallet receiver frame alignment.

c. Check stripper head for level.

d. Check mold for 5/8” dimension off mold throat.

e. Check for loose stripper shoe or plunger.

f. Check agitator grid (see section x.x).

g. Check delay time.

10.2.12 COARSE TEXTURE IN MIDDLE OF BLOCK FACE

a. Check vibrator shaft speeds.

b. Check material for coarse aggregate.

c. Check (generally increase) feed time setting.

d. Check material, could be too wet.

e. Check autofeed, make sure it's turned on.

f. Check for material segregation.

g. Check vibrator motor rotation.

H. Material segregation in machine hopper.
10.2.13 BLOCK NOT FILLED PROPERLY

a. Check agitator grid for build up.
b. Check agitator grid to make sure it is turned on.
c. Material too wet and there may be moisture variations.
d. Check that autofeed is on automatic.
e. Check hopper gate setting.
f. Check if there are chunks in feedbox.
g. Check feed time.

10.2.14 FACE SHELLS SUCKED IN AT COMPLETION OF STRIPPING

a. Check core vents, may be plugged.
b. Material too wet, moisture content variation.
c. Check for worn division plates.
d. Check for loose core assembly.
e. Check stripping speed.
f. Check admix.
g. Check for frozen aggregate.
h. Check core valve springs.
10.2.15 COARSENESS ON BOTTOM OF BLOCK LEAVING A BAD EDGE

a. Check pallet receiver rubbers.
b. Check if pallet moves during vibration.
c. Check vibrator weights, may have to change to larger or smaller vibrator weights.
d. Check mold for loose parts.
e. Check stripper head alignment.
f. Check for material segregation.
g. Check for build up on pallets or mold.
h. Check for core spillage on pallet.
i. Check moisture content of mix. It may be too dry.
j. Check vibrator shaft rotation.
k. Make sure pallet is against bottom of mold.

10.2.16 HAIRLINE CRACKING AND PULLING AT TOP OF BLOCK ON COMPLETION OF STRIPPING

a. Check spring opening to assure height pins stay together during strip.
b. Check to make sure stripper shoe protrudes through bottom of mold at completion of strip.
c. Check adjustment for stripping.
d. Check division plates for wear.
e. Check for loose stripper shoes.
f. Check moisture content of mix. It may be too wet.
10.2.17 BLOCK WIDER AT TOP THAN AT BOTTOM

Note: There are no visible cracks on the blocks.

a. Check block handling during movement to curing kilns.
b. Check block delivery on machine.
c. Check stripping adjustment.
d. Check mold assembly for wear.
e. Check curing cycle (preset & steam conditions).
f. Check admix.

10.2.18 BLOCK OUT OF SQUARE (NOT 90° ON EACH CORNER)

a. Check mold assembly for wear.
b. Check all mold parts for excessive wear.
c. Check block delivery on machine.
d. Check curing cycle (preset, steam, etc.).
10.2.19 DIAGONAL CRACK AT REAR OF BLOCK

- Pallet setting on block moving bars may be too late.
- Check forklift bumping rack on Besser-Matic.
- Check if pallet is setting down evenly on front delivery conveyor.
- Check for loose core.
- Check of loose plunger.
- Check mix design.
- Check vibrator weights.

10.2.20 DIAGONAL CRACK AT FRONT OF BLOCK

- Check if pallet hit stop on front delivery too hard.
- Check forklift bumping rack on Besser-Matic.
- Check if pallet is not setting down evenly on front delivery conveyor.
- Check for loose core.
- Check for loose plunger.
- Check mix design.
- Check for wrong vibrator weights.
10.1.21 FEATHER-EDGE AT TOP OF UNIT

a. Check alignment of stripper shoes.
b. Check for worn plungers and mold parts.
c. Check Mix design and mixing procedure.
d. Check stripping adjustment.
e. Check for mold shifting.
f. Check for loose mold parts.
g. Check stripper head alignment.
h. Check vibration.
i. Check vibrator motor brake adjustments.
j. Check admixture in batch.

10.1.22 CRACK IN MORTAR GROOVE

a. Check vibrator brakes.
b. Check for loose end liner.
c. Check for worn end liner.
d. Pallet snubbers may be necessary.
e. Check vibrator shaft speeds.
f. Check for loose mold parts.
g. Check stripping adjustment.
h. Check moisture content of mix.
i. Check mix design.
11.1 PREVENTIVE MAINTENANCE

Correct maintenance is largely a matter of good judgment on the part of the operator in charge. The SUPERPAC, like any other machine, will do the work required just as long as it is properly cared for. A good preventive maintenance program based on the recommendations below will extend the machine’s life at a high level of performance.

Check the following procedures daily and every time a product or mold change is done.

<table>
<thead>
<tr>

Table 11.3
11.2.2 BESCODYNE CLUTCH/BRAKE UNIT  

(continued)

11.2.2.1 CHECKING THE OIL LEVEL

Every week or until experience dictates otherwise, check the oil level. Always check the oil level with the drive at room temperature and while it is not running.

The drive has an oil sight gauge located at the output end of the drive. The oil level is to be at the center of the gauge.

11.2.2.2 CHANGING THE OIL

IMPORTANT: Open the disconnects to the drive motors before attempting to change the oil.

Every three months, completely drain the oil from the drive using the drain plugs provided. If the oil sight gauge is dirty, it should be removed and cleaned.

Reinstall the drain plugs and refill the drive to the center of the sight gauge with fresh oil.

Note: Do not overfill the drive unit. Excess oil will cause the unit to overheat.

11.2.2.3 TYPE OF OIL

Use only Mobil Automatic Transmission Fluid ATF-210 (type “F”) or Mobil Multi-purpose Automatic Transmission Fluid for most drives. Other fluids may be specified for special applications. Always use the type of fluid specified on the Name Plate.

11.2.2.4 CLEANING AND INSPECTION

Clean metal parts in a suitable solvent and dry in a stream of low pressure compressed air. The Clutch and Brake Drive Plates can be cleaned in solvent, but DO NOT clean the Clutch and Brake Friction Discs in solvent. Use only a clean, dry and lint-free rag to clean these Friction Discs. (Solvent will damage the resilient paper-based friction material used on the Friction Discs). Keep the Drive Plates and Friction Discs in the same order as they were removed. After cleaning, inspect parts for cracks, distortion, scoring, nicks, burrs or other damage which would affect serviceability. Pay particular attention to the following:

1. Check the disc wear surfaces for scoring, galling or evidence of uneven wear.

2. Check the clutch and brake plates for scoring or galling. Make sure they are flat. If a perceptible ridge is worn in any of the drive plates, replace all of the drive plates and friction discs as a complete set.

3. Carefully check the piston and bore surfaces for nicks, scratches, scoring or other damage which would affect operation or cause leakage.

4. Pay particular attention to Wear Sleeve (#250), Mating Ring (#4) and shafts in the area of rotary seals. Check for nicks or scratches which would cause leakage. Replace any damaged parts.

5. It is not necessary to remove the ball bearings to check their operation. Slowly rotate the free race of each bearing by hand checking to see if it turns freely without rough or flat spots.

11.2.2.5 REPAIR AND REPLACEMENT

A fine stone or crocus cloth may be used to remove minor surface defects from parts as long as the operating or sealing action of the part is not affected. The use of coarser abrasive or other machining methods should not be attempted. Otherwise, damaged parts should be replaced.

Replacement is recommended also for the following, as applicable:

1. Replace all O-Rings, Liners, Gaskets and Oil Seals removed during the course of disassembly.

2. Replace Clutch or Brake Discs and Drive Plates as complete sets only.

11.2.2.6 BELTS (ref. table 11.3)

Check wear and tension on input and output belts as described in table 11.3 (see figure 11.4 and 11.5).

Note: Refer to Bescodyne catalogue #502-03/20-001 for more complete instructions on this unit.
11.2.2.7 PROCEDURE FOR CHECKING BRAKE AND CLUTCH STACKS FOR WEAR.

An easy procedure has been established to visually check the brake and clutch stacks for wear to determine whether or not they need to be replaced.

Two “stack wear” grooves (A) have been machined in the input shaft (B) lugs to facilitate this visual check (see figure 11.2).

1. Remove the inspection pipe plug from the top of the input housing.

A. CLUTCH STACK WEAR

2. Apply air pressure to the clutch port.

3. Using a flashlight, observe the clutch stack (C) through the inspection port (A) (see figure 11.2).

   If the rear surface of the clutch thrust plate (D) has moved up to or past the “stack wear” groove (A), the clutch stack needs to be replaced (see figure 11.2).

4. Exhaust the air pressure from the clutch port.

B. BRAKE STACK WEAR

5. Apply air pressure to the brake port.

6. Using a flashlight, observe the clutch stack through the inspection port (A) (see figure 11.3).

   If the rear surface of the Thrust plate (E) has moved up to or past the “stack wear” groove #1, the brake stack is worn and needs to be replaced.

Note: Both the brake stack and the clutch stack can individually be checked for wear. If either stack is worn and needs to be replaced, both stacks should be replaced as a complete set. Refer to service manual and repair parts for clutch/brake drives (502-03/20-001) Besser catalog No. 437629F0001, section 7 - DISASSEMBLY and section 9 REASSEMBLY for brake and clutch stack replacement.
11.2.2.8 BESCODYNE UNITS SERVICE TIPS

a. KNOW THE AIR PRESSURES
   Don’t guess, be positive. Use 70 psi (4.8 bar) for Clutch. Use 50 to 55 psi (3.4 to 3.8 bar) for Brake.

b. BRAKES
   Brakes are spring-boosted, so less air pressure is required.

c. GAUGES AND REGULATORS
   Use glycerine-filled gauges; they are accurate and last longer.

d. SUPERPAC USES TWO DIFFERENT UNITS
   5S and 10S units use entirely different friction lining. Radically higher pressures will cause premature wear. Integrally piloted valve will not shift at pressures below 40 psi (2.8 bar) and must be converted to externally piloted. For a conversion, consult a Besser representative or refer to Besser Service Bulletin No. 91 -1.

e. EXCEEDING 80 psi (5.5 bar)
   Exceeding this pressure on the clutch for any length of time can result in early failure of thrust bearings.

f. AIR LINE LUBRICATION
   Use an air line lubricator only when a lubricator has been used previously. A small trace of oil in the air valve and piston of the Bescodyne can extend life. Use the same ATF oil in the lubricator as used in the Bescodyne. When adjusting the lubricator, follow the adjustment procedures as outlined by the manufacturer.

g. CLEANER AIR
   Always invest in good quality air filters, regulators and lubricators. The result of using air filters, regulators and lubricators is clean air that is free of moisture and contaminants.

h. V-BELTS
   While it is necessary to maintain enough belt tension to drive the block machine, overtightening of V-belts on the output end of the Bescodyne drive could cause fatigue breakage of the spliced output shaft. When the 4 or 5 groove output sheave becomes worn, it is tempting to over-tighten the belt to prevent slipping. When slippage occurs, replace the output sheave.

i. CHANGING OIL
   Besser recommends changing the oil in Bescodynes drives every three months. Use a Multi-Purpose ATF 210 Automatic Transmission Fluid.

   **Note:** Do Not Overfill. Refer to Besser Service Bulletin No. 93-4, for additional information.

   **Note:** DO NOT FLUSH with any solvents; we recommend to simply change the oil.

j. EXCESSIVE HEAT
   Excessive heat can be a real enemy! Keep fans intact and fan shroud in place.
Figure 11.4  INPUT PULLEY BELT TENSION.

Figure 11.5  OUTPUT PULLEY BELT TENSION.

Figure 11.6  PINION SHAFT.

Figure 11.7  GEAR TOOTH GAP.
11.2.3 REPLACING PINION SHAFT

Before replacing pinion shaft, make sure machine is in safe position. Stripper head frame and pallet receiver frame must be down. Also, make sure there is no tension on the pinion gear.

1. Remove pinion shaft assembly from machine and transfer parts to be rebuilt to new shaft.
2. Reinstall rebuilt assembly and adjust so teeth have equal pressure across width and a clearance of .012" to .019" (.3mm to .5mm).

11.2.4 BULL GEAR MAINTENANCE.

11.2.4.1 TURNING BULL GEAR

The bull gear must be turned in order to extend its life span. Turn bull bear when .020" (.5mm) clearance develops between pinion and bull gear teeth.

Before turning bull gear, make sure machine is in its safe position. Stripper head frame and pallet receiver frame must be down.

1. Unbolt bull gear from hub (bolt A in figure 11.9).
2. and turn pinion shaft to turn bull gear 90°.
3. Finally, rebolt to hub.
11.2.4.2 REPLACING PINION SHAFT

BULL AND PINION GEAR CLEARANCE AND ALIGNMENT PROCEDURE FOR MK3 STYLE PINION SHAFTS

Step 1
Insure that Pinion and Bull Gear teeth are free of debris that may be embedded in rust proof coating.

Step 2
At the location of maximum gear tooth engagement, place steel Feeler Gage stock on both sides of the center most tooth. Feeler Gage stock should equal the mid-range of the print specified backlash tolerance. (.012 +.007/-0.000 in)

Step 3
Place a straight edge (approx. 3 72 ft. long required) along the side of the Pinion Gear in a position that will allow a measurement to be taken from the front and rear of the Bull Gear edge to the straight edge. The measurement front and rear is to be equal within 1/32" to ensure the Pinion Shaft is aligned with the Cam Shaft. The second measurement should be taken at approximately 45 degrees from first measurement, followed by 2 more measurements at approximate 90 degree intervals. This will allow for most correct alignment with consideration given to .025" face run out allowed in the Bull Gear. (See Illustration)

Step 4
Use the Pinion Shaft assembly adjustments to adjust and achieve a slight "drag" on the Feeler Gage stock, and maintain the less than 1/32" difference from Step 3. This backlash should be checked at the four places where Step 3 is used.

Step 5
Tighten the Pinion Shaft Bearing Holder bolts to ensure Pinion Shaft assembly will not move.

Step 6
Spray paint (with light colored paint) the teeth on Bull and Pinion gears. Hand rotate Bull Gear 360 degrees to visually verify full gear tooth contact.

Step 7
Position keystock opposite jam bolts and weld in place.

Step 8
Tighten all fasteners.

Specific Torque Values: Bull Gear Bolts = 400 lb-ft Cam Stack
Bolts = 1200 lb-ft Pinion Bearing
Housing Bolts = 400 lb-ft

Step 9
When the machine is assembled and the Bull Gear is under a load, verify that gear tooth backlash as listed in step 2.
Figure 11.10  BULL GEAR CLEARANCE AND ALIGNMENT PROCEDURE.

Table 11.13
11.3 TRABON PUMP MAINTENANCE

The adjustments covered in this section are:

1. PUMP IN-FEED PRESSURE.

2. THE SOLENOID FLOW ADJUSTMENT controls the speed the air piston shifts.

3. THE PUMP PISTON STROKE determines how much grease is pumped each stroke.

4. LUBRICATION RATE ADJUSTMENT Adjusted through the Graphic Control Station. Refer to section 9.5: “TIMER ADJUSTMENT” - F3 -Timers 5 and 6.

5. FILLING THE GREASE PUMP.

For more complete instructions on the TRABON PUMP, refer to “Trabon Pump Owner’s Service Manual #437629F913”.

Warning: Be very careful while adjusting or troubleshooting the lube system that the machine is not turning, and the main drive motor is off.

11.3.1 TRABON IN-FEED PRESSURE ADJUSTMENT

The Trabon pneumatic pump has a air-to-lube ratio of 30 to 1. The Trabon in-feed air pressure on many Besser Vibrapacs is supplied from the Bescodyne main drive brake air regulator. In this case when the brake regulator adjustment is changed, it also affects the Trabon pump. The Trabon pump pressure ideally should be 60-80 psi [4.1-5.5 bar], which can develop at least 1800 psi [124 bar] pumping pressure.

Note: It may be advantageous to connect your Trabon pump to the Bescodyne main drive clutch rather than to the brake. The clutch air pressure adjustment is higher than the brake. Starting in 1991, Besser block machines have a separate air regulator supplied to the Trabon pumps. The plastic air solenoids on double acting pumps may not operate with less than 70 PSI [4.8 bar].

11.3.2 TRABON PISTON STROKE ADJUSTMENT

AL-5M Pump stroke adjustment for Besser block machines:

On AL-5M pumps, we recommended in the past a setting of .020 which would be 20 thousandths cubic inches of grease per stroke or .328 cubic centimeters. .020 is the middle of 3 calibration marks.

On the right side of the pump, remove the calibrated silver cap. Put the open end of the cap up against the locknut. The stroke is how far the screw sticks out and matches the calibrations on the cap. To adjust the stroke, loosen the lock nut on the adjustment screw. Turn the screw inward or clockwise to reduce the stroke. Turn the screw outward or counterclockwise to increase the stroke. The lock nut has to be retightened and the cap placed up against it again to recheck the settings after you change them. After final adjustment, tighten lock nut, then tighten silver cap onto the adjustment screw.

L-25M Pump stroke adjustment:

On AL-25M pumps used on block machines, set the pump stroke on the mark between the 30 line and the .075 line. This will be a setting of approximately .052 cubic inches which is equal to .853 cubic centimeters. The method of adjustment is described and shown in the Pump owner’s manual on page 4-2 and 4-3.

Figure 11.13 THE TRABON LUBE PUMP.
AL-25M Pump stroke adjustment for Besser slump mixers:
Set the stroke adjustment for .030 cubic inches, .492 cubic centimeters for AL-5M and AL-25M pumps.

11.3.3 TRABON SOLENOID FLOW CONTROL ADJUSTMENT FOR ALS PUMPS

The solenoid flow adjustment controls the speed at which the Trabon air piston shifts. The solenoid flow controls should be adjusted to get a gentle but positive shift of the piston without slamming.

Single acting ALS pumps have one flow adjustment which controls the in-feed air into the SA port. Depending on the air plumbing, you may have to use an offset screwdriver to adjust the flow control.

Turn the solenoid adjusting screw clockwise all the way in. Back the adjusting screw out 1/16 to 1/4 turn. Press the manual shifting override button on the air solenoid.

You should be able to hear the air piston shifting and the exhaust air exiting the DA port. Adjust the solenoid as slow as possible while still getting a positive shift of the piston. If you place your hand on the air cylinder of the Trabon pump, you should also be able to feel it shifting.

11.3.4 TRABON SOLENOID FLOW CONTROL ADJUSTMENT FOR ALJ PUMPS

On the double-acting pumps when the solenoid flow controls are adjusted, the exhaust air flow is also adjusted. When the Trabon air piston shifts forward, air flows in the SA port and out the DA port. So, to adjust the speed of the piston shift forward, turn the front or right hand flow control which adjusts the air coming out of the DA port. Loosen the lock nuts and turn both screws all the way clockwise to shut off the flow. Start by backing both screws out 1/2 turn and testing the pump shift with the plastic manual override button. The reverse speed is controlled by air for the most part, but the return spring will also be helping. The reverse speed is controlled by the exhaust air coming out of the SA port which is the back or left hand flow control. Set both flow control adjustments to obtain a positive shift without a hard, slamming action. When adjustments are completed, tighten the lock nuts so the adjustment screws cannot move out of adjustment.

11.3.5 FILLING THE GREASE PUMP

Grease To Use:
We recommend Lithium based E.P.-1 grease, such as Shell Alvania E.P. No. 1, or Mobilux E.P. No. 1. In colder climates and/or in colder months, Shell Alvania E.P. No. 0, Mobilux E.P. No. 0, or grease with equivalent specifications may be used.

Filling the Pump:
The Trabon Pump, on the average, should be filled with grease after 35 hours of operation. It is best if the pump never runs out of grease because excessive air can be introduced into the system. Before filling the pump, turn the filter handle a few times to clean it. Attach a filling pump hose to the fill stud quick disconnect located just ahead of the filter.

Warning: If a high pressure supply pump is used to fill the Trabon grease reservoirs, wear safety glasses. Pressure could build up high enough to fracture the reservoir and send particles flying.

Note: If air does get into the automatic greasing system, refer to the proper sections:
1. To bleed air from the Reservoir, refer to Section 1 in Pump owner’s manual.
2. To bleed air from the Pump, refer to Section 6 in Pump owner’s manual.
3. To bleed air from the Feeder Blocks and Grease Lines, refer to Section 9 in Pump owner’s manual.

Operate the filler pump at a steady speed to allow air-free filling of the reservoir. Filling the pump too fast may form air pockets. Also to avoid inducing air into the pump, make sure there is enough grease in the supply source to fill the reservoir without disconnecting and reconnecting the filler hose. While filling the pump, watch the grease level rise. Stop adding grease when the level reaches the air bleed hole.

Note: Never fill over the air bleed hole; this will cause a vapor lock in the system. The air bleed hole is found about 2/3, the way up the plastic reservoir on the right. When filling is complete, turn the supply source off and disconnect supply line from the fill stud. Install the plastic dust cap over the fill stud to keep dirt out of the lube system.
11.4 BEARING MAINTENANCE

11.4.1 REMEMBER THESE DO’S AND DON’TS

When handling bearings:

**DO:**

1. Remove all outside dirt from housing before exposing bearing.
2. Treat a used bearing as carefully as you would a new one.
3. Work with clean tools in clean surroundings.
4. Handle with clean, dry hands, or preferably with clean canvas gloves.
5. Use clean solvents and flushing oils.
6. Lay bearings out on clean paper.
7. Protect disassembled bearings from rust and dirt.
8. Use clean lint-free cloths or rags to wipe bearings.
9. Keep bearings wrapped in oil proof paper when not in use.
10. Clean inside of housing before replacing bearing.

**DON’T:**

1. Don’t work in dirty surroundings.
2. Don’t use dirty, brittle or chipped tools.
3. Don’t use wooden pallets or work on wooden bench tops.
4. Don’t handle with dirty, moist hands.
5. Don’t use gasoline containing tetraethyl lead, as they may be injurious to health.
6. Don’t spin unclean bearings.
7. Don’t spin bearings with compressed air.
8. Don’t use cotton waste or dirty cloths to wipe bearings.
9. Don’t expose bearings to rust or dirt.
10. Don’t nick or scratch bearing surface faces.
11.4.2 LUBRICATION TIPS

Lubrication is essential for the proper operation of bearings. Grease and oil are both used over a considerable range of speeds and operating temperatures. The choice of the type of lubricant should be made only after careful consideration of the several factors involved.

1. Keep lubricants clean. Dirt causes most bearing failures, and one easy way for it to get to bearings is to be put there in the grease. Keep covers tight on all grease cans. Use only clean dishes and clean spatulas with grease. Keep grease stored away from all dust, dirt, and metal chips.

2. Standardize your greasing procedures. Make sure all maintenance personnel understand proper greasing methods. Do not let inexperienced personnel take over greasing; it is too important. Establish precise instructions regarding cleaning of greasing equipment, grease fittings, grease cups (before refilling them). Oil cups and grease fittings can be marked with colored paints to systemize your relubrication.

3. Relubricate on schedule. Do not wait for trouble to signal the need for additional lubrication. Relubrication schedules should be posted on machines.

4. Use only high grade grease in bearings. Low grade grease is a false economy. Its use usually results in shortened bearing life. Also, try to use the grease recommended by the machine manufacturer.

5. Over-greasing is bad. It causes churning of the lubricant and subsequent over-heating. If bearing runs hot after relubrication, open the drain plug and let some of the grease run out while the bearing is operating. Never fill end-bells more than one third full when re-greasing.

6. Never start a new machine until the bearings have been lubricated according to directions.

11.4.3 WATCH OUT FOR DIRT

The most important precaution to be observed in handling or using bearings is to keep them clean. Dirt is the greatest enemy of bearings. It causes wear, destroys their accuracy, and shortens their life. To the bearing user, metal chips, grit, abrasive, dust, etc., are all DIRT. Avoid them.

11.4.4 PREVENTIVE MAINTENANCE

Have a perfectly clean work bench on which to place bearings before and after cleaning. Place the bearing in a degreaser or in a container of appropriate solvent such as standard solvent, kerosene, methyl-chloroform, or similar solvents. “Swirl” the bearing around in the cleaning solvent allowing it to wash through the bearing, carrying away any grit particles and dissolving all oil or grease. Finally, slowly revolve the inner ring so the cleaning solvent reaches all parts of the bearing. Do not allow the bearing to rest on the bottom of the container. Cleaning of a bearing interior around the balls or rollers is often done with a normal paint brush. This is a satisfactory practice although care should be taken to use a good quality brush which does not lose its bristles, and that none of the bristles become lodged between the balls or rollers and separators or rings. A piece of bristle can be as harmful as a steel chip.

ONCE IN, DIRT IS HARD TO GET OUT - A clean bearing placed on a dusty bench always becomes contaminated. Dirt, once entrenched in the separator, is exceedingly difficult to remove. Make cleanliness your first rule for working with bearings.

Bearings with closures on both sides should not be cleaned by dipping, spraying and the like, which would wash out the grease. The outer surfaces of such bearings may be carefully wiped with a lint-free cloth and light oil or solvent, after which they can be lightly coated with a protective lubricant, and wrapped to protect against dirt and corrosion.

Throughout the cleaning process, and especially where a bearing has been solvent cleaned, remember that corrosion can be caused by perspiration from hands.

So if a bearing has been solvent cleaned, wipe it carefully before applying a protective oil coat.

USE AIR WITH CAUTION - Never use unfiltered air. Make sure all traces of water and dirt in the air line are trapped out. Dirty air can blow dust into the bearing ruining careful cleaning work. Never allow the air blast to spin a bearing. If you must use air, hold bearing and hose carefully.
11.4.5 RELUBRICATE AFTER CLEANING

Always re-lubricate bearings immediately after they have been cleaned. Immerse in light clean oil and rotate the inner ring very slowly until all the solvent has been removed. Oil has a tendency to slip away from metal surfaces already wet with solvents, leaving the bearing surfaces unprotected and in danger of rust and corrosion.

11.4.6 REWRAP AFTER CLEANING

Immediately after re-lubricating the bearing, wrap well in clean polyethylene or oiled paper. Replace in its box, making sure that inside of box is also clean. Reseal the box. A good shop practice is to write on the sealing tape the date of cleaning, the type of lubricant, and the name of the person cleaning the bearing.

11.4.7 BEARING REMOVAL

Bearings may have to be removed as part of an over-haul program to service another part, or to replace the bearing. In any case, even if the bearing is an obvious failure, it should be removed with care to avoid damage to the shaft, housing or other machine parts and to avoid obliterating the cause of failure.

As mentioned before, at least one of the bearing rings is press fitted sometimes to a very tight fit. At this point, we are concerned largely with the proper handling of press fitted parts.

The first basic principle is that no press fit should be broken unless it is essential to the job being done. Many roller bearings are separable and when it is certain the bearing itself has not been damaged, it is best to leave the press fitted member in place. In addition to the time and trouble involved, removal may cause damage to the bearing seat. However, if any failure is evident, the entire bearing should be replaced. The second basic principle is that, in removing a ring, the driving force be directed through the inner or outer ring which is being removed, and not be transmitted through the balls, rollers, separators, closures and the like.

![Figure 11.14 Bearings](image-url)
The familiar arbor press is a very good machine for removing (or installing) bearings. If action is rapid, smooth and positive. In addition, it can supply a greater force than most other means. Further, it is a useful shop accessory for many other types of work. Unfortunately, space restrictions prevent its use in many jobs.

The arbor press requires various fixtures as an aid to removing or installing bearings. Although some of these aids are not inexpensive to make, their use is justified by the saving in time and by the freedom from damage to the equipment under repair. This is especially true if the job is a repetitive one.

The best fixture for pressing off inner rings from a shaft is a split ring with the outer area relieved. For most roller bearings, flat bars or U-shaped washers as shown here are quite satisfactory. They are not recommended for ball bearings since the outer ring or the closure may project beyond the inner ring face a small amount. A possible solution to this problem is to insert a small piece of shim stock about 0.01” [0.25mm] thick between the fixture and the inner ring face. Also, an interference condition can be checked by oscillating the outer ring while applying a little pressure.

The arbor press can also be used to remove outer rings from housings in those cases where the housing can be handled in the arbor press and where a portion of the outer ring is exposed. In the event the entire outer ring is exposed, a section of tubing capped by a flat bar can be used as illustrated. In other cases, where there is axial space restriction, a flat bar can sometimes be inserted to bear against the face.

Next to the arbor press, the puller is the best removal tool and is often necessary because of size and space restrictions in the arbor press. Pullers are made in different configurations and sizes and with accessories to make them adaptable to various jobs. Larger sizes are available with a hydraulic piston and hand pump.

As with the arbor press, the pressure must be applied directly through the press fitted member. In addition, where screw adjustments to the arms are made, care should be taken to pull the press fitted part off straight and true. It is advisable to use a piece of soft metal in the shaft center to prevent scoring due to the pressure of the puller screws.

The least desirable method is removal of inner and outer rings by driving with a hammer. Where machine shop facilities are available, it may be worth the effort to build a simple puller adapted to the job, especially if it is repetitive.

The use of a hammer and drift directly in the ring is very bad practice. An auxiliary fixture as shown here should be used.

Large roller bearing inner rings are particularly difficult to remove by any of the methods given here. Usually, these rings are separable and it is necessary to destroy them by heating or splitting. No specific instructions can be given here except that all attempts should be made to prevent damage to the shaft.

11.4.8 IDENTIFICATION DAMAGE AND FAILURE ON BEARINGS

INSPECTION:
When a machine or other piece of equipment is down for repair, the objective of the maintenance personnel is to repair it and get it going as soon as possible. However, some knowledge of bearing failure and damage identification is required to determine:

1. Whether the bearing is suitable for further service.

2. If there is some underlying cause for failure so that corrective measures can be applied before installing a new bearing. Here are some inspection tips and techniques to be used before or during machine dismantling. Before removing or replacing a “noisy” bearing, try to determine if the bearing is the cause. To start with, a common complaint is that the bearing is “noisy”. This is a natural reaction of machine users to unusual noise emanating from a machine. Generally, a noisy bearing produces a continuous whine. A pulsating noise is usually the result of a malfunction of some other part. It must be remembered that all ball and roller bearings have some noise level. Bearings in good condition tend to produce a pleasant sound compared to a harsh sound from one that is not functioning properly. Another point to remember is that a noisy machine is not always a sign of imminent bearing failure, but may indicate the need for lubrication.

On dismantling a machine, it is often possible to make pertinent examination of the bearing without removing it from the shaft or housing.
This is especially true with separable roller bearings, including single row tapered bearings. In such cases, major damage or failure can readily be noted. Ball bearings, being non separable, present considerably more difficulty, especially those with seats or shields.

In all cases, if failure or damage is not obvious, look for these signs:

1. A loose fit of the rotating ring. This is probably a signal that the ring has rotated and that wear has taken place. Where the ring is not loose by normal feel but there are rust-like loose particles around the fit area, check carefully for wear.

2. Indents, flaking or heavy rust on the operating surfaces. In many cases, these conditions result from metal particles thrown off by failure of an adjacent gear, or the like.

3. Undue looseness in a radial bearing. In most cases, radial shake, which can be felt by hand, is an indication that undue wear has taken place. Another sign of wear is a gritty feel of the lubricant adjacent to the bearing. In connection with the noise problem discussed earlier, keep in mind that excessive bearing wear can be a cause of noise by allowing the rotating member to move due to unbalance or other forces.

4. Missing balls or rollers. If one or more balls or rollers fall out of a separator, sufficient wear to the separator may have occurred to indicate the need for bearing replacement.

5. Rough rotation or “sticking” of the bearing when rotated by hand. This test requires considerable judgment and experience. In the case of “open” bearings, the bearing should be cleaned and lightly oiled before testing. A good practice is to clean it again using a strong solvent like varnish remover, then oil and retest. If the roughness or sticking persists, discard the bearing. Ball bearings with closures cannot, of course, be washed and oiled. These can be given the hand rotation test, repeatedly rotating and oscillating while applying a little axial pressure in one direction and then the other.

We do not recommend rotating bearings by power to check the noise characteristics. Besides the obvious danger of damage, this test requires great experience to determine if the bearing is faulty. As pointed out before, all bearings have some sound level,

If a part adjacent to the bearing has failed, it is good practice to replace the bearing even though it is not obviously damaged. It is also good practice to replace a bearing which has seen considerable service. The good judgment of the maintenance person is required here to determine a balance between the cost and difficulty of replacement vs. the possibility of a subsequent breakdown.

**11.4.9 TYPES OF BEARING DAMAGE**

Here are photographs and a description of the more common types of bearing damage. Many of these type of damage, especially in ball bearings, cannot readily be seen without dismantling the bearing. Hence, this identification is of benefit in cases of chronic failure, where a specific cause is sought. These types of failure are grouped as those caused by:

- Installation
- Operating conditions
- Normal fatigue

**11.4.10 INSTALLATION DAMAGE**

BALL RING BRINELL:This type of brinelling on the shoulders is caused by excessive thrust which pushes the balls up on the pathway and creates a triangular shaped dent or “Brinell” spot at the junction of pathway and shoulder.
11.5 SMARTPAC MAINTENANCE AND CARE

1. Store in clean dry area.

2. Lubricate bearings before storing.

4. For extended storage, spray rust preventive in tube hole & seals.

5. Handle units with care; do not hit or pry the weights.

6. Mount to good mold side bars and make sure bearing housings are seated directly to bar and vibrator bolts are properly torqued. DO NOT force by hitting the bearing housing with a hammer.

7. Lift unit by the shaft, not by bearing housing as this can damage the seals.

8. Clean quick disconnects before engaging.

9. Replace “O” ring in quick disconnects at least every month or when they become worn or damaged.

10. Never operate system pressure above 80 psi (5.5 bar).

11. Use only new clean fluid when filling the system. Contamination will cause erratic operation.

12. Do not disassemble unit.

13. To prevent crimping of shaft, Besser recommends the sheaves be tightened to 18 lbs ft. (27 N.M.) of torque. Tightening over 18 lbs ft.(27 N.M.) will cause rotary union to bind, reducing its life.

14. Never put undue pressure on rotary union fittings or connection hose.

15. Lubricate vibrator bearing every 8 hours with 1 oz [30 ml] of clean high temperature synthetic grease #114135.

16. Always have guards in place when operating vibrator motors.

17. Keep system in top condition by replacing any worn belts, sheaves, etc...
11.6 SLC CONTROLLER MAINTENANCE

11.6.1 PREVENTIVE MAINTENANCE

The printed circuit boards of the controller must be protected from dirt, oil, moisture and other airborne contaminants. In order to protect these boards, the controller must be installed in an enclosure suited to the environment. The interior of the enclosure should be kept clean and the enclosure door should be kept closed whenever possible.

Regularly inspect your terminal connections for tightness. Loose connections may cause improper functioning of the controller or damage the components of the system.

**CAUTION:** To ensure personal safety and to guard against damaging equipment, inspect connections with incoming power OFF.

The National Fire Protection Association (NFPA) gives recommendations for electrical equipment maintenance. Refer to article 70B of the NFPA for general requirements regarding safety related work practices.

11.6.2 TROUBLESHOOTING

When troubleshooting, pay careful attention to these general warnings:

**CAUTION:** Have all personnel remain clear of the controller and equipment when power is applied. The problem may be intermittent and sudden.

Unexpected machine motion could result in injury. Have someone ready to operate an Emergency Stop switch in case it becomes necessary to shut off power to the controller equipment. Also, see NFPA 70E Part II for additional guidelines for safety related work practices.

Never reach into a machine to actuate a switch since unexpected machine motion can occur and cause injury. Use a wooden stick. A metal rod could damage the machine and/or conduct current to the person holding it.

Remove all electrical power at the main power disconnect switches before checking electrical connections or inputs/outputs causing machine motion.

The SLC controller will give you reliable service. If a problem should occur, the first step in the troubleshooting procedure is to identify the problem and its source. Do this by observing your machine or process and by monitoring the diagnostic LED indicators on the CPU, Power Supply and I/O modules. By doing this, the source of a problem can generally be narrowed down to the processor, wiring, or the input/output devices.

To assist you in identifying the source of the controller’s operation problem, we have included some troubleshooting considerations including status indication, trouble description, probable causes and recommended action.

11.6.3 DIAGNOSTIC CHECKS

A. Battery

The SLC Controller has power supplied by a lithium battery. The battery is located in the power supply inside the control panel. Replace the battery if the low battery signal activates. See figure 11.15 (page 11-23).

B. Fuses

A burned-out fuse may cause the power supply indicator light to illuminate in controller. Check the two fuses, located behind the lithium battery. The battery is located in the SLC-500 control panel. Replace burned-out fuses with new fuses. See figure 11.15 (page 11-23).

C. Circuit breakers

A tripped circuit breaker may result for no apparent reason. Check the circuit breakers, located in the SLC control panel, and reset any tripped circuit breakers. See figure 11.15 (page 11-23).

D. Memory loss

When the power to the panel goes off due to a power surge, drop or a dead battery, a memory loss may result. The CPU fault light will illuminate to indicate problem. To restore the memory, turn the panel power OFF. Insert EPROM into the inside of the processor. Restore the power. The SLC-500 will automatically read the EPROM into its RAM and go into RUN mode. The CPU light will illuminate to indicate a successful transfer. Turn the power OFF. Remove the EPROM from the unit.
11.6.4 USING THE TROUBLESHOOTING CONSIDERATIONS TABLE GUIDE

To receive the maximum benefit of this Table Guide, we recommend the following steps in using its information:

1. Identify your Power Supply and CPU LED status indicators.

2. Match your controller’s status LED indicators with the status LED indicators located in the first column in the Troubleshooting Considerations Table.

3. Once the LED status indicators are matched to the appropriate table, simply move across the table identifying trouble Description and Probable Causes.

4. Then follow the Recommended Action steps for each probable cause until the cause is identified.

5. If Recommended Actions do not identify the cause of trouble, contact your local Allen-Bradley Sales Office.

Figure 11.15  SLC CONTROLLER BATTERY, FUSES, EPROM AND CIRCUIT BREAKERS.
### 11.6.5 TROUBLESHOOTING TABLE GUIDE

Refer to the following log to determine the status of the LED indicators:

- Indicates that LED is OFF
- Indicates that LED is ILLUMINATED
- Indicates that LED is FLASHING

</table>

' On modular SLC configuration systems, you will find the POWER LED indicator on the rack mounted power supply of each rack.

Note: erratic repetitive power cycling can cause a CPU major hardware fault.

d. Clear status file S:1/13 major error bits, if set.
e. Clear status file S:5 minor error bits, if set.
f. Clear status file S:6 major error code (optional)
g. Attempt a CPU RUN mode entry. If unsuccessful, repeat recommended action steps above.

2. Use the keyswitch to clear the fault. Toggle the keyswitch to PROG and back to RUN. (see page 9-11 of the SLC manual). If FAULT occurs again, use programmer to get error code and determine the source of the problem.
Refer to the following log to determine the status of the LED indicators:

- Indicates that LED is OFF
- Indicates that LED is ILLUMINATED
- Indicates that LED is FLASHING

### TROUBLESHOOTING CONSIDERATION

<table>

| ![POWER1](image)  | System does not operate per ladder logic. | User forced I/O disabling operation | 1. Monitor program file online and identify forced I/O.  
2. Disable appropriate forces and test system conditions again.  
Refer to either the Hand-Held terminal programming manual - Publication 1747-809 or the Advanced programming software manual - Publication 1747-801. |
| ![PC RUN](image)   | System does not operate per programmed forces. | Forces user programmed are not enabled. | 1. Monitor program file on-line and identify programmed forces.  
2. Enable appropriate forces and test system conditions again. Once forces are enabled FORCED I/O LED should be steady.  
Refer to the Advanced programming software manual - Publication 1747-6.4. |
| ![CPU FAULT](image) | CPU major error with low or NO battery back-up | Loss of RAM memory during power down period | 1. Verify battery is connected. See pages 5-1 and 8-5 of the SLC manual.  
2. Replace the battery if you want RAM battery backup. See page 8-5 of the SLC manual.  
3. Refer to CPU major error recommended action steps.  
Refer to the Advanced programming software manual - Publication 1747-6.4. |

1. On modular SLC configuration systems, you will find the POWER LED indicator on the rack mounted power supply of each rack.
2. Regardless of any other LED status indicator conditions, always replace the battery when the BATTERY LOW LED indicator is illuminated if RAM battery back-up is desired.
12.1 SMARTPAC

This section will show you Smartpac vibration system. With this option, an electric motor (see figure 12.1) is turning all the time and a cam activated by air change position to start and stop vibration.

THEORY OF OPERATION
Concrete and mold combinations each have unique vibratory characteristics. Each has an optimum amplitude and frequency for filling and consolidating. Concrete units can be made to the highest quality in the shortest time by matching the optimum frequency and amplitude for feed and for finish.

12.1.1 AMPLITUDE
Limits have been preset for both low and high speed of the motors to prevent operation outside optimum parameters. Amplitude is adjustable from 0 to 100% of 6500 or 9000 lb. Amplitude should not be set below 30% as vibration will not synchronize and will be erratic.

12.1.2 SYSTEM INSTALLATION
12.1.2.1 Make mechanical and electrical changes according to drawing supplied by BESSER and check that all parts are aligned properly.

12.1.2.2 Attach correct length shafts to the mold you want to run.

12.1.2.3 Make sure the right hand shaft is on right side and the left one is on left side.
12.1.2.5 Disconnect lower hoses from “V” fitting on dump valve assemblies and fill with ATF fluid.

12.1.2.6 Make sure all air is removed from the hoses.

12.1.2.7 Fill control unit tank with ATF fluid. Keep tank 3/4 full during setup and operation.

12.1.2.8 Connect 80 PSI – 5 SCFM air supply to control unit.

12.1.2.9 Set air pressure for rod end of cylinder to 60 PSI and Cap End of cylinder to 30 PSI (see figure 12.2).

12.1.2.10 Operate air valve to extend rod of air cylinder. Install mold with SmartPac vibrator shafts and attach hoses to dump valve assemblies.

12.1.2.11 Retract air cylinder, wait 2 seconds, then extend rod, repeat process until both vibrators shift 90 degrees

Note: when rod is retracted. If vibrators don’t shift fully, refill bottom hoses on dump valves.

12.1.2.12 When rod is extended, both weights return to balanced position.

Note: DO NOT run system if vibrators or control unit are not functioning properly.

12.1.3 VIBRATOR FREQUENCY

To set frequency of vibrator:

12.1.3.1 stop machine with feed drawer over the mold.

12.1.3.2. Start vibrator motors with vibration off.

Note: Check that the top belts are both going towards the center of the machine.

12.1.3.3 Bring up the SmartPac screen on the monitor and set the speed of shafts to 2900 RPM. Note: Check the speed with a strobe light or photo tachometer.

12.1.3.4 Adjust one motor so it runs exactly the same speed as the other. Registers N10:30 and N10:31 may be used to adjust motor speeds.

Note: On non AFC units, adjust frequency drive to match shaft speeds.

12.1.4 AMPLITUDE ADJUSTMENTS

Amplitude adjustments are made with vibrator motors stopped and large cylinder rod fully extended. Adjust the transducer to read zero by monitoring register #N10:21 (see section 9.9.6).

12.1.5 TRANSUCER ADJUSTMENT

To adjust transducer (see figure 12.2):

12.1.5.1 Loosen mounting (A) then move transducer (B) to get zero in register. Retighten screw.

12.1.5.2 Retract rod on air cylinder (C) by manually activating valve. The reading should go to between 900 and 1000 and both weights should be shifted 90 degrees.

12.1.5.3 Extend rod and recheck zero.

12.1.5.4 Enter 0 into register #N10:26.

12.1.5.5 Set amplitude on the SmartPac screen to 500 and with vibrator motors off, turn vibrator switch to “hand”.

12.1.5.6 Check register #N10:21 reading and subtract 500, enter this into register #N10:26 on SLC500. This is your Offset to compensate for delays in the system. This will have to be updated from time to time.

12.1.5.7 Operate vibration "hand" and check register N10:21 reading, it should be close to 500. The weights should be shifting about half way.
Figure 12.2  SMARTPAC PANEL.
12.2 FREQUENCY DRIVE OPTION

12.2.1 DISPLAY PANEL KEY DESCRIPTIONS

Escape
When pressed, the ESCape key will cause the programming system to go back one level in the menu tree.

Select
Pressing the SELect key alternately causes the top or bottom line of the display to become active. The flashing first character indicates which line is active.

Increment/Decrement
These keys are used to increment and decrement a value or scroll through different groups or parameters.

Enter
When pressed, a group or parameter will be selected or a parameter value will be entered into memory. After a parameter has been entered into memory, the top line of the display will automatically become active, allowing another parameter (or group) to be chosen.

12.2.2 OPERATION

EX: To change a preset input mode value on the main drive or Smartpac, follow the steps below:

1. The status display must read “Stopped + 0.00 Hz” (see figure 17.1).
2. Press the ESC key.
   Status display reads “Choose Mode”.
3. Press the or key.
   Keep pressing until you reach “Program”.
4. Press the key.
5. Press the or key.
   Keep pressing until you reach “Setup”.
6. Press the key.
7. Press the or key.
   Keep pressing until you reach “Input Mode 2”.
8. Press the key.
   You can now change the numerical value with the help of the keys. Select the desired value.
9. Press
   The change is recorded. To come back to step 1 (initial position), press ESC until “Stopped + 0.00 Hz” appears on display.
Note: Other parameters that can be changed in the Setup menu includes “Freq Select”, “Accel Time”, “Decel Time” and “Minimum Freq”. When in “Setup” mode, press increment/decrement keys to choose another one of these parameters.

Also, if you choose “Frequency Set” instead of “Setup” in step 5, you can establish preset frequencies: “Preset Freq 1” and “Preset Freq 2”. Follow the same steps to change preset frequencies.

12.3 STANDARD VIBRATION SYSTEM

![Figure 12.4 STANDARD VIBRATOR MOTOR BRAKE.]

12.3.1 OPERATION

The standard vibrator motor brakes are electronically controlled by the computer. They vibrate the mold from the moment the feedbox is on its way forward until the strip delay timer starts. At this point, the computer powers the brake to stop vibrator motor.

GENERAL ADVISES ON STANDARD VIBRATION

A. Vibration weights must be centered on shafts, with bolts on the outside.

B. Always use same weights on both shafts.

**WARNING:** Make adjustments on vibrator motor brakes only with all power shut off. Disconnect motor and lock it out to avoid injuries.

12.3.2 BESCODYNE

12.3.2.1 The Air Plumbing

Please refer to fig 12.5 or to the view found on Besser print No.443847. Notice that the inlet air does not have a regulator on it. Before hooking up the inlet air, a pressure gage should be connected to determine the air pressure. If it ranges between 50 and 150 PSI the gage can be removed.

12.3.2.2 Operational Instructions

In preparation for adjusting the pressure regulators correctly, the following items should be checked first.

1) Are the vibrator belts in matched sets and in good condition on both sides between the vibrator motor output and the Bescodyne inputs, and also between the Bescodyne outputs and sheaves. (Replace belts in matched sets only. If belts are replaced on one side, they also should be on the other.)

2) Is the belt tension between the motor output and the Bescodyne input equal left and right? If not, adjust the tensioning screws on the motor bases until they are equal.

3) Are the sheaves in good condition. If not, all the sheaves should be replaced in sets.

Adjusting the Air Regulators

Note: Size 5S Bescodyne Drives Serial numbers 38900 and lower were supplied with bronze friction discs. If the friction discs have not been updated to a paper fibre material then it will take higher air pressures such as 40 to 50 PSI to operate them.

If it is not recommended that a Bescodyne with discs be matched up with a Bescodyne with bronze discs.

Use the following methods to adjust the Bescodynes, but remember the bronze discs will take higher air pressures than the typical paper disc settings listed below.
1) Set both regulators at 22 PSI as a starting point.
2) During normal operation, use an amprobe to measure, record and compare the peak starting amps on all 3 legs of both vibrator motors. The average amperage should be within 2 amps when comparing left to right.
3) While maintaining at least 18 PSI on each Bescodyne unit, raise the pressure on the side exhibiting lower amperage until the amps are about equal.
4) If one (1) regulator is set more than 10 PSI above the other side to achieve equal amps, check the pressure gage first. Secondly check belts, sheaves and the belt tenions to make sure they are matched form one side to the other.

The above instructions will provide synchronized vibration. Check item 2 above once a week or every time a mold is changed. Readjust the regulators if necessary.

12.3.2.3 Adjusting the Air Regulators

Note: Size 5S Bescodyne Drives Serial numbers 38900 and lower were supplied with bronze friction discs. If the friction discs have not been updated to a paper fibre material then it will take higher air pressures such as 40 to 50 PSI to operate them.

If is not recommended that a Bescodyne with discs be matched up with a Bescodyne with bronze discs.

Use the following methods to adjust the Bescodynes, but remember the bronze discs will take higher air pressures than the typical paper disc settings listed below.

1) Set both regulators at 22 PSI as a starting point.
2) During normal operation, use an amprobe to measure, record and compare the peak starting amps on all 3 legs of both vibrator motors. The average amperage should be within 2 amps when comparing left to right.
3) While maintaining at least 18 PSI on each Bescodyne unit, raise the pressure on the side exhibiting lower amperage until the amps are about equal.
4) If one (1) regulator is set more than 10 PSI above the other side to achieve equal amps, check the pressure gage first. Secondly check belts, sheaves and the belt tenions to make sure they are matched form one side to the other.

The above instructions will provide synchronized vibration. Check item 2 above once a week or every time a mold is changed. Readjust the regulators if necessary.

APPENDIX B
ELECTRICAL DIAGRAMS

Because of different voltages, models and customer's control preferences, we have not included the electrical wiring diagrams, list of materials or electrical information in this manual.

The electrical wiring diagrams of your machine and other electrical information are supplied with your equipment, depending of the type of controls and electrical system.
APPENDIX D

LIMIT SWITCH LOCATIONS

LS-2A will prevent start of machine after 2nd stop if front conveyor is not clear.
PRS-3: a pallet in position.
LS-5: Autofeed over travel safety.
LS-6: Block moving bars home allows start after 2nd stop.
LS-7: Block moving bars forward.
LS-10: Lube reservoir low.
LS-11: Lube cycle switch.
PS-13: Air pressure low (Located on opposite side of machine).
PRS-8: Pallet magazine low limit.
PRS-18: Pallet magazine high limit (interlock to Bessermatic loader / unloader).
